Story of barcoding

- Early 2000's: beginning of barcoding

- 1st DNA barcode: 65 bases of the mitochondrial gene of Cytochrome Oxidase I (COI) dedicated to the identification of vertebrates

- 2007: 1st international published database

- 2009: chloroplastic markers - RBCL (Ribulose Biphosphate Carboxylase; 553 pairs of bases) and MATK (MATurase K; 879 pairs of bases) -> standard markers for plants

- 2012: ITS, standard marker of fungi (length between 361–1475 bases in UNITE 7.1)

- 16S marker, mainly used for bacteria but no designated standard.

Which barcode ?

Microbial lineages vary in their genomic contents, which suggests that different genes might be needed to resolve the diversity within certain taxonomic groups.

- 16S rRNA
- 23S rRNA,
- DNA gyrase subunit B (gyrB),
- RNA polymerase subunit B (rpoB),
- TU elongation factor (tuf),
- DNA recombinase protein (recA),
- protein synthesis elongation factor-G (fusA),
- dinitrogenase protein subunit D (nifD),
- Internal Transcribed Spacer (ITS) for Fungi.

The gene encoding the small subunit of the ribosomal RNA

The most widely used gene in **molecular phylogenetic** studies

Ubiquist gene : **16S rDNA** in prokaryotes ; **18S rDNA** in eukaryotes

Gene encoding a ribosomal RNA : non-coding RNA (not translated), part of the small subunit of the ribosome which is responsible for the translation of mRNA in proteins

Not submitted to lateral gene transfer

Availability of databases facilitating comparison
(Silva v138.1 - 2021: available SSU/LSU sequences to over **10,700,000**)
Secondary structure of

the 16S rRNA of

Escherichia coli

In red, fragment R1 including regions V1 and V2;
in orange, fragment R2 including region V3;
in yellow, fragment R3 including region V4;
in green, fragment R4 including regions V5 and V6;
in blue, fragment R5 including regions V7 and V8;
and in purple, fragment R6 including region V9.

16S rRNA structure

16S rRNA copy number

16S rRNA copy number

Median of the number of *16S rRNA* copies in 3,070 bacterial species according to data reported in *rrn*DB database – 2018

https://rrndb.umms.med.umich.edu/search/

2022:
Bacillus megaterium entre 1 à 21 copies selon les souches (médiane à 13)
Photobacterium damselae entre 15 et 21 copie selon les souches (médiane à 17)

16S rRNA copy variation
E. coli

[B] The positions of sequence variation within 16S and 23S rRNA are shown along the gene organization of rrn operons. A total of 33 and 77 differences were identified in 16S rRNA and 23S rRNA, respectively.

[C] The number of bases that are different from the conserved sequence are shown for 16S and 23S rRNA for each rrn operon.

Sequencing produces marker reads

Steps for Illumina sequencing

- 1st step : one PCR
- 2nd step: one PCR
- 3rd step: on flow cell, the cluster generations
- 4th step: sequencing
Cluster generation

Prepare Genomic DNA Sample
Randomly fragment genomic DNA and ligate adapters to both ends of the fragments.

Attach DNA to Surface
Bind single-stranded fragments randomly to the inside surface of the flow cell channels.

Attach DNA to surface

Bridge Amplification
Add unlabeled nucleotides and enzyme to initiate solid-phase bridge amplification.

Bridge amplification

Cluster generation

Fragments Become Double Stranded
The enzyme incorporates nucleotides to build double-stranded bridges on the solid-phase substrate.

Fragments become double stranded

Denature the Double-Stranded Molecules
Denaturation leaves single-stranded templates anchored to the substrate.

Denature the double-stranded molecule

Complete Amplification
Several million dense clusters of double-stranded DNA are generated in each channel of the flow cell.

Cycle of new strand synthesis and denaturation to make multiple copies of the same sequence (amplification)
Reverse strands are washed

Sequencing by synthesis

Determine First Base
The first sequencing cycle begins by adding four labeled reversible terminators, primers, and DNA polymerase.

Light signal is more strong in cluster

Image First Base

After laser excitation, the emitted fluorescence from each cluster is captured and the first base is identified.

Determine Second Base
The next cycle repeats the incorporation of four labeled reversible terminators, primers, and DNA polymerase.

Sequencing by synthesis

Image Second Chemistry Cycle

After laser excitation, the image is captured as before, and the identity of the second base is recorded.

Sequencing Over Multiple Chemistry Cycles

GCTGA...
The sequencing cycles are repeated to determine the sequence of bases in a fragment, one base at a time.

Barcode is read, so cluster is identified.
After first sequencing (250 or 300 nt of Reverse strand), fragment form bridges again and Forward strand can be sequenced also.

Sequencing

Index 1

Read 1

Read 2
Amplification and sequencing

Sequencing is generally perform ~~on~~ ~~Roche-454~~ or Illumina MiSeq platforms or Oxford Nanopore Technology or PACBIO platforms.

Read quantity: ~10 000 reads per sample (454), ~30 000 reads per sample (MiSeq), up to several Tera of data (ONT).

Sequence lengths: >650 bp (Roche-454), 2 x 250 bp or 2 x 300 bp (MiSeq), Longest read > 2Mb (ONT or PACBIO)

Methods

Exemple of FROGS Pipeline

Basic tools
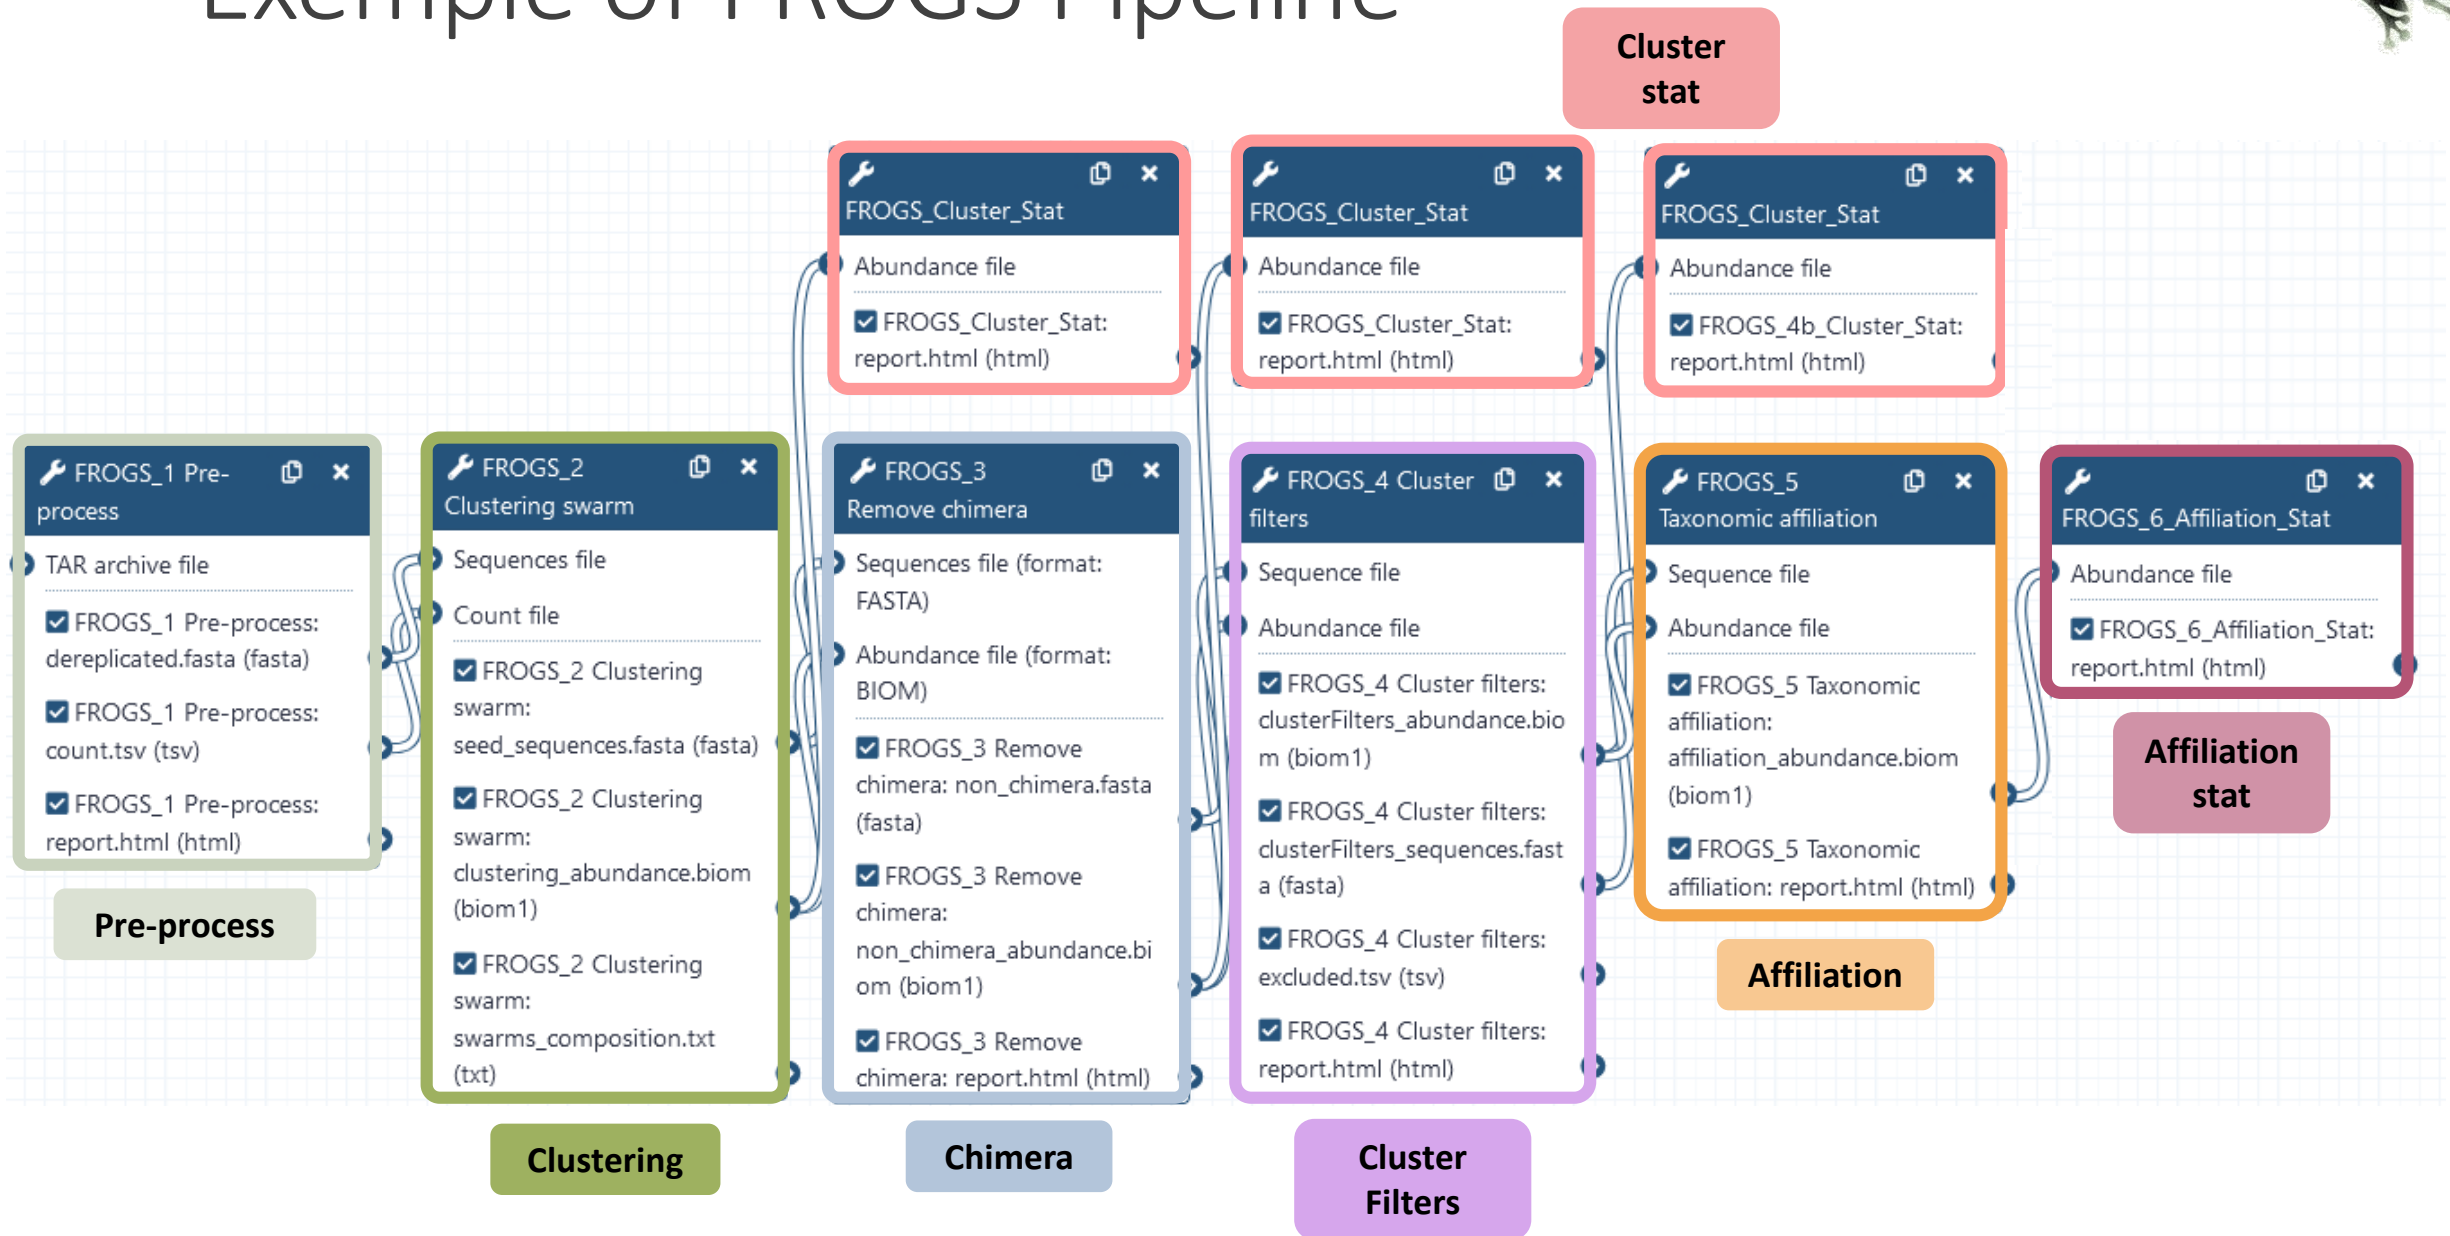

FROGS_0 Demultiplex reads Attribute reads to samples in function of inner barcode

FROGS_1 Pre-process merging, denoising and dereplication

FROGS_2 Clustering swarm Single-linkage clustering on sequences

FROGS_Cluster_Stat Process some metrics on clusters

FROGS_3 Remove chimera Remove PCR chimera in each sample

FROGS_4 Cluster filters Filters clusters on several criteria.

FROGS ITSx Extract the highly variable ITS1 and ITS2 subregions from ITS sequences

FROGS_5 Taxonomic affiliation Taxonomic affiliation of each ASV's seed by RDPtools and BLAST

FROGS_6_Affiliation_Stat Process some metrics on taxonomies

Statistics tools

FROGSSTAT Phyloseq Import Data from 3 files: biomfile, samplefile, treefile

FROGSSTAT Phyloseq Composition Visualisation with bar plot and composition plot

FROGSSTAT Phyloseq Alpha Diversity with richness plot

FROGSSTAT Phyloseq Beta Diversity distance matrix

FROGSSTAT Phyloseq Sample Clustering of samples using different linkage methods

FROGSSTAT Phyloseq Structure Visualisation with heatmap plot and ordination plot

FROGSSTAT Phyloseq Multivariate Analysis Of Variance perform Multivariate Analysis of Variance (MANOVA)

FROGSSTAT DESeq2 Preprocess import a Phyloseq object and prepare it for DESeq2 differential abundance analysis a

FROGSSTAT DESeq2 Visualisation extract and visualise differentially abundant ASVs or functions

Optional basic tools

FROGS Tree Reconstruction of phylogenetic tree

FROGS Affiliation Filters Filters ASVs on several affiliation criteria

FROGS Affiliation postprocess Aggregates ASVs based on alignment metrics

FROGS Abundance normalisation Normalise ASV abundance.

Functional inference tools

FROGSFUNC_1_placeseqs_and_copynumbers Places ASVs into a reference phylogenetic tree.

FROGSFUNC_2_functions Calculates functions abundances in each sample.

FROGSFUNC_3_pathways Calculates pathway abundances in each sample.

Utilities tools

FROGS BIOM to std BIOM Converts a FROGS BIOM in fully compatible BIOM

FROGS TSV_to_BIOM Converts a TSV file in a BIOM file 1

FROGS BIOM to TSV Converts a BIOM file in TSV file

28 tools in total

MgArd0062	AGCTCGC
MgArd0073	AGTATCT
MgArd0081	AGTCTGC

if index is in only at forward:
tabular file with 2 columns
sample names + barcodes

Advices

- Do not forget to indicate barcode sequence as they are in the fastq sequence file, especially if you have data multiplexed via the reverse strand.

- For the mismatch threshold, we advised you to let the threshold to 0, and if you are not satisfied by the result, try with 1. The number of mismatch depends on the length of the barcode, but often those sequences are very short so 1 mismatch is already more than the sequencing error rate.

- If you have different barcode lengths, you must demultiplex your data in different times beginning by the longest barcode set and used the "unmatched" or "ambiguous" sequence with smaller barcode and so on.

- If you have Roche 454 sequences in sff format, you must convert them with some program like sff2fastq

Outputs

7: FROGS_0 Demultiplex reads: report

6: FROGS_0 Demultiplex reads: undemultiplexed.tar.gz

5: FROGS_0 Demultiplex reads: demultiplexed.tar.gz

1	2
#sample	count
ambiguous	0
MgArd0009	91
MgArd0017	166
MgArd0038	1208
MgArd0029	193
unmatched	245
MgArd0001	119
MgArd0081	246
MgArd0046	401
MgArd0054	243
MgArd0073	474
MgArd0062	1127

With barcode mismatches >1 sequence can corresponding to several samples. Sequences that match at only one sample are affected to this sample but the others (ambiguous) are not re-affected to a sample.

A tar archive is created by grouping one (or a pair of) fastq file per sample with the names indicated in the first column of the barcode tabular file.

Sequences without known barcode. So these sequences are non-affected to a sample.

Format: Barcode

BARCODE FILE is expected to be tabulated:
- first column corresponds to the sample name (unique, without space)
- second to the forward sequence barcode used (None if only reverse barcode)
- optional third is the reverse sequence barcode (optional)

Take care to indicate sequence barcode in the strand of the read, so you may need to reverse complement the reverse barcode sequence. Barcode sequence must have the same length.

Example of barcode file.
The last column is optional, like this, it describes sample multiplexed by both fragment ends.

MgArd00001	ACAGCGT	ACGTACA

Format : FastQ

FASTQ : Text file describing biological sequence in 4 lines format:

- first line start by "@" correspond to the sequence identifier and optionally the sequence description. "@Sequence_1 description1"
- second line is the sequence itself. "ACAGC"
- third line is a "+" following by the sequence identifier or not depending on the version
- fourth line is the quality sequence, one code per base. The code depends on the version and the sequencer

```
@HNHOSKD01ALD0H
ACAGCGTCAGAGGGGTACCAGTCAGCCATGACGTAGCACGTACA
+
CCCFFFFFFHHHHHJJIJJJHHFF@DEDDDDDDD@CDDDDACDD
```

How it works ?

For each sequence or sequence pair the sequence fragment at the beginning (forward multiplexing) of the (first) read or at the end (reverse multiplexing) of the (second) read will be compare to all barcode sequence.

If this fragment is equal (with less or equal mismatch than the threshold) to one (and only one) barcode, the fragment is trimmed and the sequence will be attributed to the corresponding sample.

Finally fastq files (or pair of fastq files) for each sample are included in an archive, and a report describes how many sequence are attributed for each sample.

1-Preprocess tool

What does the Pre-process tool do?

- Merging of R1 and R2 reads with vsearch, flash or pear (only in command line)

- Delete sequences without good primers

- Finds and removes adapter sequences with cutadapt

- Delete sequence with not expected lengths

- Delete sequences with ambiguous bases (N)

- Dereplication

- + removing homopolymers (size = 8) for 454 data

- + quality filter for 454 data

How work reads merging ?

WITH VSEARCH

The aim of Vsearch is to merge R1 with R2

Case of a sequencing of overlapping sequences: case of 16S V3-V4 amplicon MiSeq sequencing:

Imagine a real amplicon sequence of 400bp

400bp

Imagine a Miseq paired sequencing of 2x250bp

R1 : 250bp

R2 : 250bp

Reconstructing amplicon sequence is possible thanks to the overlap region

Merged sequence length : 400bp, with 100bp overlap

The aim of Vsearch is to merge R1 with R2

Case of a sequencing of over-overlapping sequences:

Imagine a real amplicon sequence of 200bp

200bp

Imagine a Miseq paired sequencing of 2x250bp

R1 : 250bp

R2 : 250bp

FROGS takes in charge this case in trimming over bases

200bp

Merged sequence length : 200bp, with 100% overlap

Practice:

Exercise

Vsearch

Vsearch is recommended (in command line, prefer pear)

Select the software to merge paired-end reads (--merge-software)

Would you like to keep unmerged reads?

⊘ No, unmerged reads will be excluded.
○ Yes, unmerged reads will be artificially combined.

No = Unmerged reads will be excluded; Yes = unmerged reads will be artificially combined with 100 N. (default No) (--keep-unmerged)

Minimum amplicon size

400

The minimum size of the amplicons (with primers) (--min-amplicon-size)

Maximum amplicon size

580

The maximum size of the amplicons (with primers) (--max-amplicon-size)

Do the sequences have PCR primers?

⊘ Yes
○ No

5' primer

AGAGTTTGATCCTGGCTCAG

The 5' primer sequence (wildcards are accepted). This primer must be written in 5' to 3' orientation (see details in 'Primers parameters' help section) (--five-prim-primer)

3' primer

CCAGCAGCCGCGGTAAT

The 3' primer sequence (wildcards are accepted). This primer must be written in 5' to 3' orientation (see details in 'Primers parameters' help section) (--three-prim-primer)

Amplicon length distribution before trimming and filtering

Minimum amplicon size

400

The minimum size of the amplicons (with primers) (--min-amplicon-size)

Maximum amplicon size

580

The maximum size of the amplicons (with primers) (--max-amplicon-size)

Do the sequences have PCR primers?

⊘ Yes
○ No

5' primer

AGAGTTTGATCCTGGCTCAG

The 5' primer sequence (wildcards are accepted). This primer must be writte

3' primer

CCAGCAGCCGCGGTAAT

The 3' primer sequence (wildcards are accepted). This primer must be written in 5' to 3' orientation (see details in 'Primers parameters' help section) (--three-prim-primer)

FROGS_1 Pre-process merging, denoising and dereplication (Galaxy Version 4.1.0+galaxy1)

Sequencer

Illumina

Select the sequencing technology used to produce the sequences.

Input type

TAR Archive

Samples files can be provided in a single TAR archive or sample by sample (with one or two files each).

TAR archive file

[📄] [📋] [📁] | 1: chaillou_withprimers_64renamedsamples_V1V3_10000seq_R1R2.tar.gz

The TAR file containing the sequences file(s) for each sample.

Are reads already merged ?

No

Yes = The archive contains 1 file by sample : R1 and R2 pairs are already merged in one sequence.

Reads 1 size

300

The maximum read1 size.

Reads 2 size

300

The maximum read2 size.

Mismatch rate

0.1

The maximum rate of mismatches in the overlap

Merge software

Vsearch

Select the software to merge paired-end reads

Would you like to keep unmerged reads?

⊘ No, unmerged reads will be excluded.
○ Yes, unmerged reads will be artificially combined.

No = Unmerged reads will be excluded; Yes = unmerged reads will be artificially combined with 100 N. (default No) (--keep-unmerged)

To check the sequence quality use FASTQC (present in galaxy tools)

Tools ☆

fastqc ✕

With selection: | 📈 Display amplicon lengths | 📈 Display preprocessed amplicon lengths |

at the bottom of the table

Q10: What is the length of your merged reads before preprocessing ?
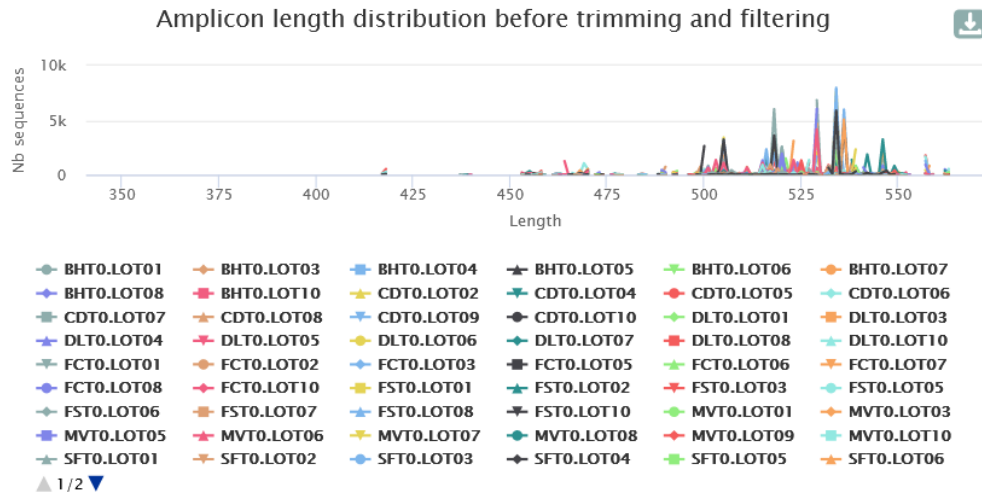

Before the preprocessing,
400 < sequence length < 555
After the preprocessing, the
sequences were shortened

Q11: What can you tell about the samples, based on amplicon size distributions ?

Preprocessed Amplicon Length distribution
« Filet Cabillaud » samples
« Saumon Fumé » samples
« Bœuf Haché » samples
For each EnvType, we can observe different amplicon sizes. They correspond to different species.
N.B. amplicons with same size can represent different species.

2-Clustering tool

Why do we need clustering ?

Amplication and sequencing are not perfect processes

- Polymerase error during PCR?

- Sequencing errors ?

- Natural variations ?

Natural variability ?
Technical noise?
Contaminant?
Chimeras?
Expected

Results

Natural variability ?
Technical noise?
Contaminant?
Chimeras?

Expected

Results

16S variability
Cf. RRNDB (ribosomal RNA operons database)
https://rrndb.umms.med.umich.edu/search/
max. 21 copies of 16S in bacteria (*Photobacterium damselae*)
ex. *E. coli* 7 copies

expected
A   B
results

To have the best accuracy:

Method: All against all

- Very accurate

- Requires a lot of memory and/or time

=> Impossible on very large datasets without strong filtering or sampling

How traditional clustering works ?
Input order dependent results
Single a priori clustering threshold
compromise threshold
unadapted threshold
natural limits of clusters

Swarm clustering method

differences: ACGT/AGGT = 1, ACGT/A-GT = 1, ACGT/A--T = 2

initial seed (randomly picked from amplicon dataset)

explore the amplicon space

no more closely related amplicons, the process stops (equivalent to the Kruskal algorithm when d = 1)

1diff

This sequences is the seed of the cluster.
Only the seed is kept for next processes.

The abundances of each sequence in the cluster are added together.
And the total abundance is given to the seed.

Comparison Swarm and 3% clusterings

radius (97%)

Radius expressed as a percentage of identity with the central amplicon (97% is by far the most widely used clustering threshold)

Comparison Swarm and 3% clusterings

TARA V9 (264 samples)

TARA V9 (908 samples)

crown size (numbers of amplicons in the OTU)

seed abundance (numbers of copies)

identity (%)

97

90
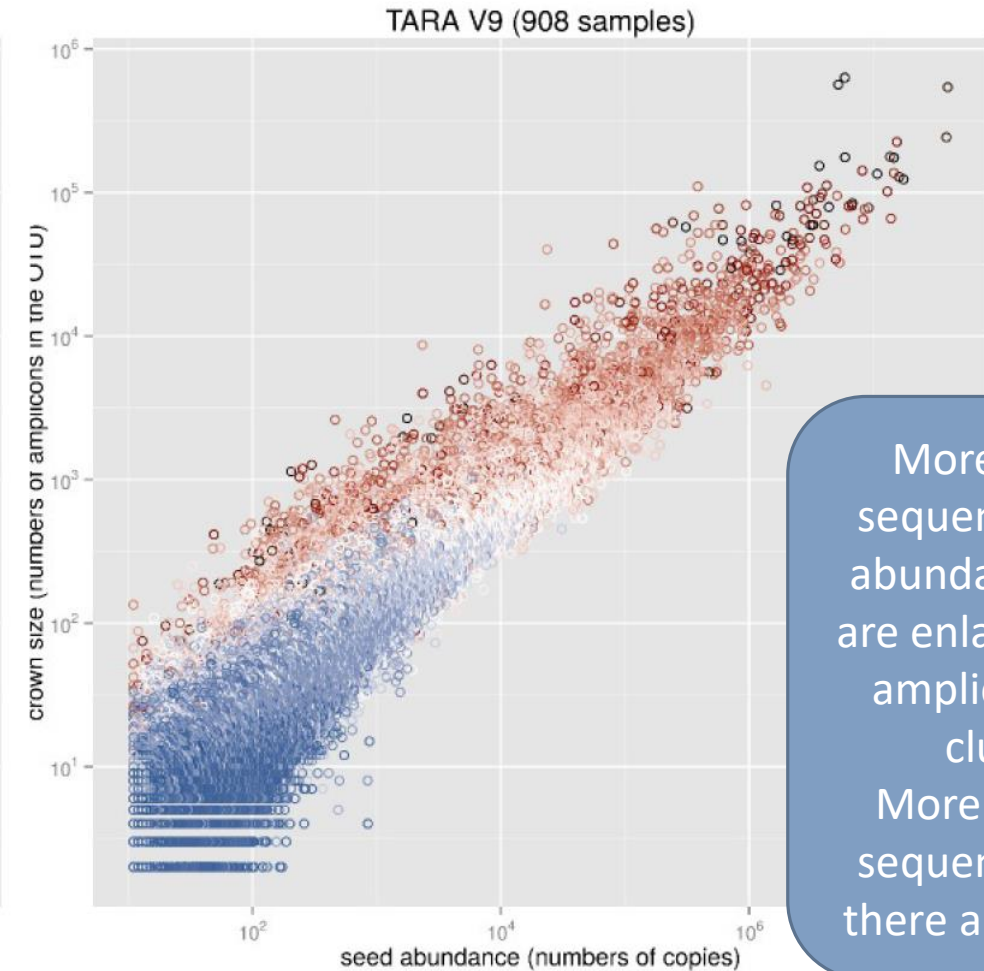

More there is sequences, more abundant clusters are enlarged (more amplicon in the cluster).
More there are sequences, more there are artefacts

clusters produced with swarm using d = 1

FROGS_2 Clustering swarm Single-linkage clustering on sequences
(Galaxy Version 4.1.0+galaxy1)

☆ Favorite &⃝ Versions ▾ Options

Sequences file

3: FROGS_1 Pre-process: dereplicated.fasta

The dereplicated sequences file (format: FASTA)

Count file

4: FROGS_1 Pre-process: count.tsv

It contains the count by sample for each sequence (format: TSV)

FROGS guidelines version

New guidelines from version 3.2

The denoising step before a d3 clustering is no longer recommended since FROGS 3.2, but you can still choose it.

Aggregation distance clustering

1

Maximum number of differences between sequences in each aggregation Swarm step. (recommended d=1) (--distance)

Refine clustering

⊘ Yes, refine clustering with --fastidious swarm option
○ No, perform clustering without refinment

Clustering will be performed with the Swarm --fastidious option. It is recommended and only usable in association with a distance of 1 (default and recommended: Yes) (--fastidious)

longer but more accurate

small cluster (made of 2 rare amplicons)

virtual amplicon

Mahé, Frédéric et al. "Swarm v2: highly-scalable and high-resolution amplicon clustering." *PeerJ* vol. 3 e1420. 10 Dec. 2015, doi:10.7717/peerj.1420
Cluster stat tool

A RECURRENT TOOL

Practice:

LAUNCH CLUSTERING AND CLUSTERSTAT TOOLS

Exercise

Go to « 16S » history

Launch the Clustering SWARM tool on that data set with guideline 3.2 *i.e. aggregation distance =1*

→ objectives :
- understand the outputs from clustering
- understand the ClusterStat utility

Exercise

1. How many clusters do you get ?

Launch FROGS **Cluster Stat tools** on the previous abundance biom file

FROGS Clusters stat Process
some metrics on clusters.

Exercise

2. Interpret the boxplot: **Clusters size summary**

3. Interpret the table: **Clusters size details - How many single singletons do you find?**

4. What can we say by observing the **sequence distribution**?

5. How many clusters share "BHT0.LOT08" with at least one other sample?

6. How many clusters could we expect to be shared ?

7. How many sequences represent the 106 specific clusters of "CDT0.LOT06"?

8. This represents what proportion of "CDT0.LOT06"?

9. What do you think about it?

10. How do you interpret the « Hierarchical clustering » ?

Q1: How many clusters do you get ?

Q2: Interpret the boxplot: **Clusters size summary**

Q3: Interpret the table: **Clusters size details -**
How many single singletons do you find?

Clusters distribution   Sequences distribution   Samples distribution

Clusters
20,038

Sequences
569,471

Clusters size summary

The cluster size is the sum of the abundances of the sequences grouped in a cluster.

Clusters size distribution

Decile	Value
Min	1
1	1
2	1
3	1
4	1
Median	1
6	1
7	1
8	1
9	1
Max	84,849
Most of clusters are singletons

Q4: What can we say by observing the sequence distribution?

Cumulative sequences proportion by cluster size

Most of sequences are contained in big clusters

N.B.: Select area to zoom in.
The small clusters represent few sequences

	Total clusters	Shared clusters	Own clusters	Total sequences	Shared sequences	Own sequences
BHT0.LOT01	493	114	379	9,089	8,709	380
BHT0.LOT03	433	140	293	8,9		
BHT0.LOT04	474	152	322	8,9		
BHT0.LOT05	475	152	323	8,8		
BHT0.LOT06	490	156	334	8,996	8,662	334
BHT0.LOT07	531	165	366	9,059	8,690	369
BHT0.LOT08	430	201	229	8,715	8,486	229
BHT0.LOT10		7		8,937	8,630	307
CDT0.LOT02				9,270	8,767	503
CDT0.LOT04				8,918	8,609	309
CDT0.LOT05	384	241	143	8,520	8,377	143
CDT0.LOT06	365	256	109	8,373	8,264	109
CDT0.LOT07	512	100	412			
CDT0.LOT08	556	162	394			

Q5: How many clusters share "BHT0.LOT08" with at least one other sample?
Q6: How many clusters could we expect to be shared ?
Q7: How many sequences represent the 106 specific clusters of "CDT0.LOT06"?
Q8: This represents what proportion of "CDT0.LOT06"?
Q9: What do you think about it?

201 clusters of BHT0.LOT08 are common at least once with another sample

~30 % of the specific clusters of CDT0.LOT06 represent around ~1% of sequences
Could be interesting to remove if individual variability is not the concern of user

Q10: How do you interpret the « Hierarchical clustering » ?
The « Hierachical clustering » is established with a Bray Curtis distance particularly well adapted to abundance table of very heterogenous values (very big and very small figures).

Newick tree available too, can be copied and pasted an tree viewer

Newick

Samples distribution tab

Answer 10

Q10: How do you interpret the « Hierarchical clustering » ?

N.B.: Hierarchical clustering is not all a phylogenetic tree ! Please consult with caution.

Open in FigTree v1.4.4

Not very clear
3-Chimera removal tool

What is chimera ?

PCR-generated chimeras are typically created when an aborted amplicon acts as a primer for a heterologous template. Subsequent chimeras are about the same length as the non-chimeric amplicon and contain the forward (for.) and reverse (rev.) primer sequence at each end of the amplicon.

Chimera: from 5 to 45% of reads (Haas 2011 doi: 10.1101/gr.112730.110)

aborted amplification

next cycle's "primer"

chimeric sequence

for.   rev.

A smart removal chimera to be accurate

We use a sample cross-validation

Sample A

a		x1000
b		x500
c		x100
d		x50
e		x10
f		x10
g		x5

Sample B

b		x1000
d		x500
h		x100
i		x50
f		x10
e		x10
g		x5
" **d** " is view as chimera by Vsearch
Its " parents " are presents

" **d** " is view as normal sequence by Vsearch because it have not " parents ".

$\Rightarrow$ For FROGS "d" is not a chimera
$\Rightarrow$ For FROGS "g" is a chimera, "g" is removed
$\Rightarrow$ FROGS increases the detection specificity

Practice:

LAUNCH THE REMOVE CHIMERA TOOL

Exercise

Go to « 16S » history

Launch the « FROGS_3 Remove Chimera » tool

Follow by the « FROGS ClusterStat » tool

→ objectives :
- understand the efficiency of the chimera removal
- make links between small abundant ASVs and chimeras

FROGS_3 Remove chimera Remove PCR chimera in each sample (Galaxy Version 4.1.0+galaxy1)

Sequences file (format: FASTA)
6: FROGS_2 Clustering swarm: seed_sequences.fasta

The sequences file

Abundance type

BIOM file

Select the type of file where the abundance of each sequence by sample is stored.

Abundance file (format: BIOM)

7: FROGS_2 Clustering swarm: clustering_abundance.biom

It contains the count by sample for each sequence.

Exercise

1. Understand the « FROGS remove chimera : report.html»
   a. How many clusters are kept after chimera removal?
   b. How many sequences that represent ? So what abundance?
   c. What do you conclude ?

2. What is the size of the largest removed cluster of chimeras?

3. Compare the HTML files
   a. Of what are mainly composed singleton ? (compare with previous report.html)
   b. What are their abundance?
   c. What do you conclude ?

Answer 1

Q1a: How many clusters are kept after chimera removal?
Q1b: How many sequences that represent ? So what abundance?
Q1c: What do you conclude ?

Remove summary

Clusters

Abundance

Kept : 6,023

Removed : 14,015

Removed : 14,395

Kept : 555,076
6023 clusters are kept.
The 14015 removed clusters represent ~2.5 % of sequences

Here, chimera clusters represent many clusters ~70% but very few sequences.

Removed clusters are low abundance clusters.

Q2: What is the size of the largest removed cluster of chimeras?

Sample	Clusters kept	% Clusters kept	Cluster abundance kept	% Cluster abundance kept	Chimeric clusters removed	Chimeric abundance removed	Abundance of the most abundant chimera removed	Individual chimera detected	Individual chimera abundance detected	Abundance of the most abundant individual chimera detected
VHT0.LOT02	205	35.90	8,862		410		19	372	446	19
MVT0.LOT10	254	60.48	9,313		180		10	169	304	92
VHT0.LOT08	261	45.87	8,852		332		10	310	344	11
VHT0.LOT01	198	35.42	8,832	95.90	361	378	8	365	382	8

The largest cluster of chimeras contained 19 sequences.

92 chimeras are detected but only 10 are removed because 82 have been invalidated by the cross validation

Answer 3

Q3b: What are their abundance?
Q3c: What do you conclude ?

Cluster_Stat report after clustering

Cluster size	Number of cluster	% of all clusters
1	19,267	96.15
2	150	0.75
3	22	0.11
4	10	0.05

Most small clusters are composed of chimeras

Cluster size	Number of cluster	% of all clusters
1	5,387	89.44
2	49	0.81
3	15	0.25
4	7	0.12

Cluster_Stat report after chimera removing

4- Cluster Filter tool

4- Cluster Filter

Goal: This tool deletes clusters among conditions enter by user. If an cluster reply to at least 1 criteria, the cluster is deleted.

Criteria:

The cluster prevalence: The number of times the cluster is present in the environment, *i.e.* the number of samples where the cluster must be present.

Cluster size: An cluster that is not large enough for a given proportion or count will be removed.

Biggest Cluster : Only the X biggest are conserved.

Contaminant: If cluster sequence matches with phiX, chloroplastic/mitochondrial 16S of A. Thaliana or your own contaminant sequence.

FROGS_4 Cluster filters Filters clusters on several criteria. (Galaxy Version 4.1.0+galaxy1)

☆ Favorite ▾ Options

One tool, 4 criteria

Sequence file

📄 📋 📁 | 15: FROGS_4 Cluster filters: clusterFilters_sequences.fasta ▾ | 📂

The sequence file to filter (format: FASTA)

Abundance file

📄 📋 📁 | 14: FROGS_4 Cluster filters: clusterFilters_abundance.biom ▾ | 📂

The abundance file to filter (format: BIOM)

Minimum prevalence method

① all samples ▾

Minimum prevalence

Fill the field only if you want this treatment. Keep cluster if it is present in at least this number of samples.

Minimum cluster abundancy as proportion or count. We recommend to use a proportion of 0.00005.

② as proportion ▾

Minimum proportion of sequences abundancy to keep cluster

Fill the field only if you want this treatment. Example: 0.00005, recommended by Bokulich et al 2013, to keep cluster with at least 0.005% of all sequences (--min_abundance)

N biggest clusters

③

Fill the fields only if you want this treatment. Keep the N biggest clusters (--nb-biggest-clusters)

Search for contaminant clusters.

④ No contaminant filter ▾

Either you use your own contaminant fasta file or you select one among available ones. (--contaminant)

Prevalence filter – option 1

FROGS_4 Cluster filters Filters clusters on several criteria. (Galaxy Version 4.1.0+galaxy1)   ☆ Favorite   ▾ Options

Sequences file

9: FROGS Remove chimera: non_chimera.fasta

The sequence file to filter (format: FASTA)

Abundance file

10: FROGS Remove chimera: non_chimera_abundance.biom

The abundance file to filter (format: BIOM)

Minimum prevalence method

all samples

Minimum prevalence

4

Here, user wants that each cluster are present in at least 4 samples.

Fill the field only if you want this treatment. Keep OTU if it is present in at least this number of samples.

Prevalence filter – option 2

FROGS_4 Cluster filters Filters clusters on several criteria. (Galaxy Version 4.1.0+galaxy1)

☆ Favorite   ▾ Options

Sequences file

9: FROGS Remove chimera: non_chimera.fasta

The sequence file to filter (format: FASTA)

Abundance file

10: FROGS Remove chimera: non_chimera_abundance.biom

The abundance file to filter (format: BIOM)

Minimum prevalence method

replicate identification

> Need to know group composition

File of replicated sample names

12: chaillou_replicate_information.tsv

Replicate file to link each sample to its group (cf. Help section).

> Here, user wants that each cluster of its group to be present in at least half of samples making up the group

Minimum prevalence

0.5

Fill the field only if you want this treatment. Keep OTU present in at least this proportion of replicates in at least one group (must be a proportion between 0 and 1).

Prevalence filter – option 2

How to build the file of replicated sample names ?

The file must consist of only 2 columns, separated by a tab.

The first column contains the exact names of the samples (exactly those contained in the biom file)

The second column contains the name of the group to which they belong. Please note that group names must not contain accents, spaces or special characters.

Example:

sample1	rich
sample2	rich
sample3	rich
sample4	richAB
sample5	richAB
sample6	richAB
sample7	richAB
sample8	richAB
sample9	low
sample10	lowAB
sample11	lowAB
sample12	april21
sample13	april21

Thanks to get data tool, add it in your history

Prevalence filter – option 2

Results:

if we want to keep the clusters that are present in at least 50% of the samples of a same group, we set the threshold at 0.5.

The process will therefore keep the clusters present in at least

    2 "rich" samples

    3 "richAB" samples,

    1 "lowAB" sample

    1 "april21" sample

sample1	rich
sample2	rich
sample3	rich
sample4	richAB
sample5	richAB
sample6	richAB
sample7	richAB
sample8	richAB
sample9	low
sample10	lowAB
sample11	lowAB
sample12	april21
sample13	april21

and all clusters in sample9 since it is the only representative of the "low" condition.

Prevalence filter – option 2

mistakes not to be made:

sample1 rich
sample2 rich
sample3 rich
sample4 richAB
sample5 richAB
sample6 richAB
sample7 richAB
sample8 low
sample9 lowAB
sample10  lowAB
sample11  lowAB
sample12  april21
sample13  april21
```

valid

```
sample1 rich
sample2 rich
sample 3  rich
sample4 richAB
sample5 richAB
sample6 richAB
sample7 richAB
sample8 low
sample9 lowAB
sample10  lowAB
sample11  lowAB
sample12  april21
sample13  april21
```

Creates artificially 3 columns

```
sample1 rich
sample2 rich
sample3 rich
sample4 rich AB
sample5 richAB
sample6 richAB
sample7 richAB
sample8 low
sample9 lowAB
sample10  lowAB
sample11  lowAB
sample12  april21
sample13  april21
```

Creates artificially 3 columns

Minimum cluster abundancy as proportion or count. We recommend to use a proportion of 0.00005.

as proportion ▾

Minimum proportion of sequences abundancy to keep cluster

5e-05

Fill the field only if you want this treatment. Example: 0.00005, recommended by Bokulich et al 2013, to keep cluster with at least 0.005% of all sequences (--min_abundance)

OR

Minimum cluster abundancy as proportion or count. We recommend to use a proportion of 0.00005.

as count ▾

Minimum number of sequences to keep cluster

2

Fill the field only if you want this treatment. Ex: 2 to keep cluster with at least 2 sequences, so remove single singleton (--min_abundance)

Here, user wants that each cluster has an abundance representing at least 0.005% of total number of sequences (*i.e.* 0.00005).

Here, user wants that each cluster has an abundance at least equals to 2 sequences -> single singleton will be removed.

Filter : Keep biggest cluster

N biggest clusters

50

Fill the fields only if you want this treatment. Keep the N biggest clusters (--nb-biggest-clusters)

Here, user wants to keep the 50 biggest clusters.

Search for contaminant clusters.

Use contaminant FASTA file from the server ▾

Either you use your own contaminant fasta file or you select one among available ones. (--contaminant)

Contaminant databank

phiX

For example the phiX databank (the phiX is a control added in Illumina sequencing technologies).

Remove phiX sequence (use as buffer while sequencing)

OR

Search for contaminant clusters.

Use contaminant FASTA file from the server

Either you use your own contaminant fasta file or you select one among available ones. (--contaminant)

Contaminant databank

Arabidopsis TAIR10 Chloroplast and mitochondria

For example the phiX databank (the phiX is a control added in Illumina sequencing technologies).

Remove chloroplastic and mitochondrial 16S sequences of *A. Thaliana*

OR

Search for contaminant clusters.

Use contaminant FASTA file from the history ▾

Either you use your own contaminant fasta file or you select one among available ones. (--contaminant)

Select a contaminante reference from history

18: contaminant.fasta ▾

Add in your history (with getadata tool) your own file of contaminant sequences in fasta format.

133

Practice:

LAUNCH THE CLUSTER FILTER TOOL

Exercice:

Go to history « 16S » history

Launch « cluster Filter » tool with non_chimera_abundance.biom, non_chimera.fasta

Use 3 criteria to filter clusters:

- cluster must be present at least in 4 samples
- Each cluster must represented a minimum of 0.005 % = 0.00005 [1] of the totality of the sequences
- cluster of phiX [2] must be removed

→ objective : play with filters, understand their impacts on falses-positives clusters

[1] *Nat Methods. 2013 Jan;10(1):57-9. doi: 10.1038/nmeth.2276. Epub 2012 Dec 2.*
Quality-filtering vastly improves diversity estimates from Illumina amplicon sequencing.

The abundance file (format: BIOM)

Exercise

1. What are the « **FROGS_5 taxonomic affiliation tool** » output files ?

2. How many sequences are affiliated by BLAST ?

3. How many ASV have a "multiaffiliation" at Order ranks ?

4. Click on the « eye » button on the BIOM output file, what do you understand ?

Exercise

Use the **Biom_to_TSV tool** on this last file and click again on the "eye" 👁
on the new output generated.

FROGS BIOM to TSV Converts a BIOM file in TSV file (Galaxy Version 4.1.0+galaxy1)

Abundance file

20: FROGS_5 Taxonomic affiliation: affiliation_abundance.biom

The BIOM file to convert (format: BIOM)

Sequences file (optional)

15: FROGS_4 Cluster filters: clusterFilters_sequences.fasta

The sequences file (format: fasta). If you use this option the sequences will be add in TSV.

Extract multi-alignments

- ⊘ Yes
- ○ No

If you have used FROGS_5_tax   lignements in a second TSV.

> Transform the biom file in TSV file (easy to manipulate on excel or R)

> Optional but very useful, insert sequence of ASV in the abundance table

> Build the multi-affiliations.tsv: the list of possible affiliations for each ambiguous ASV with multiaffiliation

156

Exercise

5. Click again on the "eye" 👁 on the new output generated.

Or open it in your favorite spreadsheet (Excel, google sheet, Calc…) !

Now, what do you think about the file format? What does it contain?

Exercise

6. Observe and describe

- In FROGS BIOM to TSV: abundance_silva.tsv, the different columns of cluster 3

   a. how would you qualify the alignment between the ASV3 seed and the sequences of the silva database?

   b. What does it mean e-value = 0 ?

   c. What is the header of column that shows the sequence of ASV seed ?

   d. How many sequences have ASV3 in total ?

   e. How many sequences have ASV3 in MVT0.LOT10 ? What is the sample where ASV3 is absent ?

Exercise

7. Observe and describe

◦ In FROGS BIOM to TSV: multi_affiliations.tsv, identifies the lines corresponding to cluster3

a. Why cluster3 has a multiaffiliation for species ?

b. Why "Bacteria;Firmicutes;Bacilli;Lactobacillales;Lactobacillaceae;Latilactobacillus;Lactobacillus sakei" is present 74 times ?

Q1: What are the « **FROGS_5 taxonomic affiliation tool** » output files ?

Q2: How many sequences are affiliated by BLAST ?

Exercise

Answer 1

21: FROGS_5 Taxonomic affiliation: report.html

20: FROGS_5 Taxonomic affiliation: affiliation_abundance.biom

Answer 2

All sequences have a blast affiliation

Q3: How many ASV have a "multiaffiliation" at Order ranks ?

Most of ASVs are ambiguous at species rank.
For this study, V1V3 amplicon is not resolutive enough to identify the species.

Blast multi-affiliation summary

Multi-affiliation by taxonomic rank

Order

The biom file is not a human readable format. It is only very useful for bioinformaticians.
To read the abundance table you have to transform the BIOM file in TSV file thanks to **BIOM_to_TSV tool**.

Q5: what do you think about the TSV file format? What does it contain?

The TSV format: tabular separated Value.
Universal format, ideal for different spreadsheets.

This file contain the abundance table and information about affiliation of ASVs.

a. how would you qualify the alignment between the ASV3 (cluster_3) seed and the sequences of the silva database?

Alignment is perfect ! 100% identity and 100% coverage between ASV3 (cluster 3) seed and the 520 nucleotides of sequence from silva database

b. What does it mean e-value = 0 ?

The expect value is a parameter that describes the number of hits one can "expect" to see by chance when searching a database of a particular size. The lower the e-value, or the closer it is to zero, the more "significant" the match is.

c. What is the header of column that shows the sequence of ASV seed ?

Seed_sequence

d. How many sequences have ASV3 (cluster_3) in total ?

40711 found in column " observation_sum"

e. How many sequences have ASV3 (cluster_3) in MVT0.LOT10 ? What is the sample where ASV3 (cluster_3) is absent ?

MVT0.LOT10
4
0
6722
13
20

CDT0.LOT02
64
1
0
0
3

We can remark that ASV3 is particularly present in MV samples and rare in CD samples

a. Why ASV3 (cluster_3) has a multiaffiliation for species ?

In multi-affiliations.tsv file, for cluster_3, we observe that 75 affiliations are possible for this ASV at species rank.

All strictly equivalent 100% identity and 100% coverage with 75 different sequences of silva database.

ctobacillus;Lactobacillus sakei	CP025206.1448122.1449699	100	100	0	520

b. Why "Bacteria;Firmicutes;Bacilli;Lactobacillales;Lactobacillaceae;Latilactobacillus;Lactobacillus sakei" is present 74 times ?

Because these are 74 different strains of *L. sakei*. They have blast ID different.

Silva pintail or not pintail ?

Pintail* represents the probability that the rRNA sequence contains anomalies or is a chimera, where 100 means that the probability for being anomalous or chimeric is low.

4 ranks of available databases in FROGS: 50 pintail, 80 pintail or 100 pintail or no pintail filter.

- you have a preconceived notion
- you are familiar with the environment being studied
- you are looking for specific organisms as pathogens
- you collect bibliographical information

Ex:

Staphylococcus saprophyticus is a bacterium that can cause urinary tract infections in young women
and
Staphylococcus xylosus exists as a commensal on the skin of humans and animals and in the environment. It appears to be <u>much more common in animals</u> than in humans. S. xylosus has very occasionally been identified as a cause of human infection.

Maybe, for this cluster, S. xylosus is better

Affiliation explorer

A very user-friendly tool, developed by Mahendra Mariadassou and his collaborators (Maiage unit - INRAE Jouy-en-Josas). It allows to modify very simply the affiliations of an abundance table from FROGS.

Affiliation explorer

Demo video

6- Affiliation Stat

Practice:

LAUNCH THE FROGS_6 AFFILIATION STAT TOOL

Exercice:

Go to history « 16S » history

Launch the « FROGS_6 Affiliation Stat » tool on last affiliation_abundance.biom

→ objectives :

understand rarefaction curves and the diversity diagram

Exercice:

1. Build the **rarefaction** curve on genus rank with the 10 samples that contain the least number of different genus.

2. SFT0.LOT06 and MVT0.LOT10 have they been sequenced deeply enough?

3. Build the **distribution** on FC samples *i.e.* "Filet de Cabillaud"

4. How many sequences are some *Brochothrix thermosphacta* ?

5. On the total of sequences, what is the proportion affiliated to the Firmicutes?

6. Among Firmicutes, how many are Bacilli ?

7. But what is the proportion of Firmicutes in the total of sequence of all sample ?

8. How many ASVs are align perfectly with a database sequence ?

Q1: Build the **rarefaction** curve on genus rank with the 10 samples that contain the least number of different genus.

	Samples	Nb domain	Nb phylum	Nb class	Nb order	Nb family	Nb genus	Nb species	Nb sequences
☑	SFT0.LOT06	1	4	5	9	14			
☑				5	12	26	35	57	8,821
☑	SFT0.LOT01	1	4	6	13	27	39	63	8,859
☑	FCT0.LOT01	1	5	6	13	24	41	96	8,504
☑	SFT0.LOT05	1	5	7	18	32	50	95	8,728
☑	SFT0.LOT08	1	4	6	13	33	53	77	8,788
☑	BHT0.LOT01	1	7	9	20	35	5		
☑	SFT0.LOT04	1	6	8	17	34	5		
☑	SFT0.LOT03	1	5	8	1				
☑	SFT0.LOT02	1	6	7	1				
☐	MVT0.LOT10	1	4	5	17	31	57	83	9,143
☐	CDT0.LOT02	1	6	8	22	36	58	85	8,750

1. Sort the table by genus number

2. Select the 10 first samples

3. At the bottom of the table click on

With selection: Genus ▾ 📈 Display rarefaction   🥧 Display distribution

Answer 2

Q2: SFT0.LOT06 and MVT0.LOT10 have they been sequenced deeply enough?

For this sample, with ~6500 sequences, all genus are represented

The curve makes a plateau from this point.

Here, the plateau comes with a depth of ~8000 sequences

Nb Genus

Nb sampled sequences

SFT0.LOT06   SFT0.LOT07   SFT0.LOT01
SFT0.LOT05   SFT0.LOT08   BHT0.LOT01
SFT0.LOT03   MVT0.LOT10
Answer 2

Q2: SFT0.LOT06 and MVT0.LOT10 have they been sequenced deeply enough?
For MVTO.LOT10, the plateau does no seem to have been reached. Perhaps should have been sequenced more deeply?

Rarefaction

Rarefaction curves

Nb Genus

60

40

20

0

0   1k   2k   3k   4k   5k   6k   7k   8k   9k

Nb sampled sequences

- SFT0.LOT06   SFT0.LOT07   SFT0.LOT01   FCT0.LOT01   SFT0.LOT05   SFT0.LOT08
- BHT0.LOT01   SFT0.LOT04   SFT0.LOT03   MVT0.LOT10

With ~8000 sequences, all genus for this species are represented

Answer 3 4 & 5

Q3: Build the **distribution** on FC samples *i.e.* "Filet de Cabillaud"
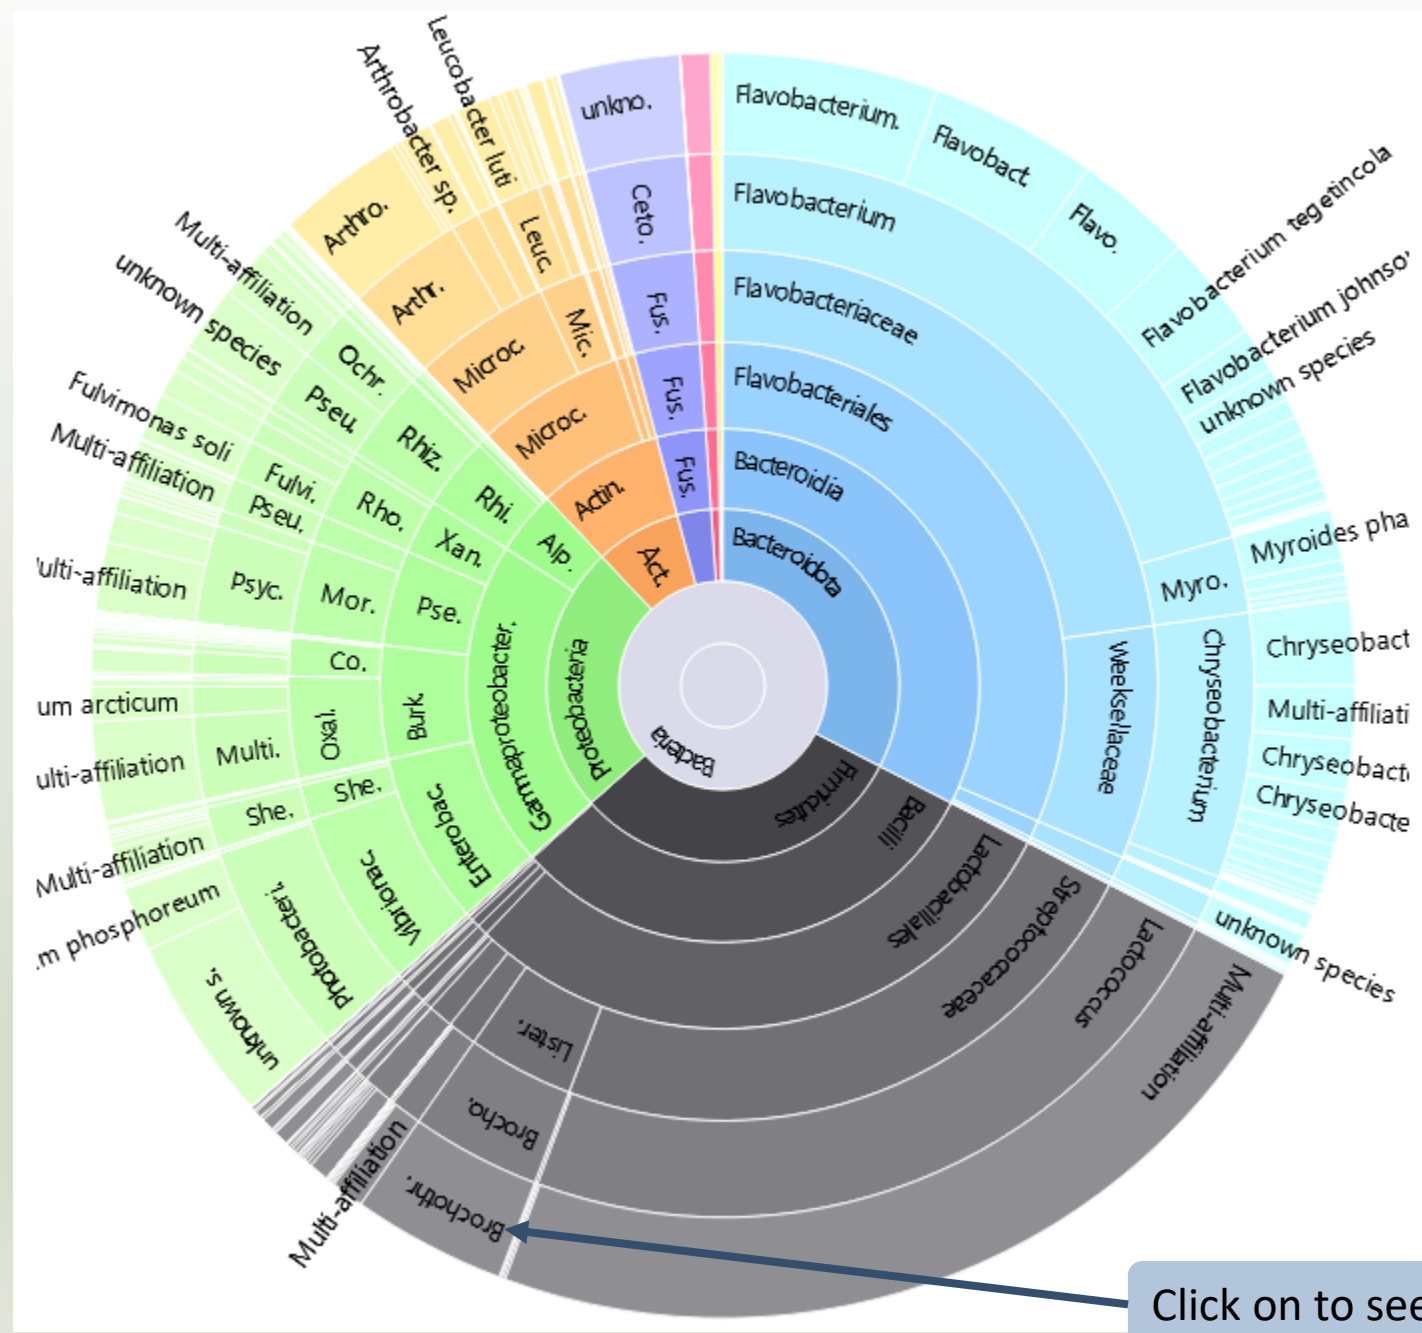

Click on to see *Brochothrix thermosphacta*

Q4: How many sequences are some *Brochothrix thermosphacta* ?
Q5: On the total of sequences, what is the proportion affiliated to the Firmicutes?
Q6: Among Firmicutes, how many are Bacilli ?

Name	Size	Global %	Parent %
root	67211		
Bacteria	67211	100.000	100.000
Firmicutes	20741	30.860	30.860
Bacilli	20658	30.736	99.600
Lactobacillales	19871	29.565	96.190
Listeriaceae	2649	3.941	13.331
Brochothrix	2649	3.941	100.000
Brochothrix thermosphacta	2649	3.941	100.000

Brochothrix thermosphacta nb children: 0
Detail on selected:

Name	Size	Global %	Parent %
root	67211		
Bacteria	67211	100.000	100.000
Firmicutes	20741	30.860	30.860
Bacilli	20658	30.736	99.600
Lactobacillales	19871	29.565	96.190
Listeriaceae	2649	3.941	13.331
Brochothrix	2649	3.941	100.000
Brochothrix thermosphacta	2649	3.941	100.000

Brochothrix thermosphacta nb children: 0

A table appears

- 2649 sequences are some *Brochothrix thermosphacta*
- Firmicutes represent ~30% of total of sequences of these samples
- 99.6% of Firmicutes are Bacilli

186

Q7: But what is the proportion of Firmicutes in the total of sequence of all sample ?

193

Keyword filters of blast affiliation

○ No filter
⊘ Ignore taxa
○ Keep taxa

Do you want to keep or ignore blast affiliations according a keyword ?

Remove blast affiliations including these taxon / word

1: Remove blast affiliations including these taxon / word

Full or partial taxon name

unknow species

Example: "unknown species" or "subsp." (--ignore-blast-taxa)

2: Remove blast affiliations including these taxon / word

Full or partial taxon name

Firmicutes

Example: "unknown species" or "subsp." (--ignore-blast-taxa)

➕ Insert Remove blast affiliations including these taxon / word

Filter on RDP affiliations

Possibility to filter for keeping or for ignore ASV according keywords

"Ignore taxa": all Blast taxonomic affiliation with the keyword i.e. Firmicutes will be deleted or hidden

"Keep taxa": only Blast taxonomic affiliation with the keyword i.e. Firmicutes will be kept

Careful, it is case sensitive. Firmicutes it's different of firmicutes !

Possibility to filter on RDP taxonomic affiliation

Not open by default

Practice:

LAUNCH THE FROGS AFFILIATION FILTER TOOL

Exercice:

1. Mask

   1. all ASV that have not at least 95% identity and 95% coverage with a Silva sequence

   2. and that are not a *unknown species*

2. Explore the report.html

   ▪ How many ASVs remain?
   ▪ How are impacted affiliation?

42: FROGS Affiliation Filters: impacted_clusters.multi-affiliations.tsv

Cluster_3	Bacteria;Firmicutes;Bacilli;Lactobacillales;Lactobacillaceae;Latilactobacillus;Lactobacillus sakei
Cluster_3	Bacteria;Firmicutes;Bacilli;Lactobacillales;Lactobacillaceae;Latilactobacillus;Lactobacillus sakei
Cluster_3	Bacteria;Firmicutes;Bacilli;Lactobacillales;Lactobacillaceae;Latilactobacillus;Lactobacillus sakei
Cluster_3	Bacteria;Firmicutes;Bacilli;Lactobacillales;Lactobacillaceae;Latilactobacillus;Lactobacillus sakei
Cluster_3	Bacteria;Firmicutes;Bacilli;Lactobacillales;Lactobacillaceae;Latilactobacillus;Lactobacillus sakei
Cluster_3	Bacteria;Firmicutes;Bacilli;Lactobacillales;Lactobacillaceae;Latilactobacillus;unknown species

To see the content, think to transform the BIOM to TSV file with **BIOM_to_TSV tool**

Exemple: Cluster_3 is an impacted clusters because
- its multi-affiliation "unknow species" was deleted
- but all other affiliation were kept.

41: FROGS Affiliation Filters: impacted_clusters.tsv

Remark ●
In deleting mode, in the abundance table, all information concerning the ASVs affected by the filter are removed (affiliation, metrics and count in the different samples)

Normalization

Normalization

Conserve a predefined number of sequence per sample:

- update Biom abundance file
- update seed fasta file

May be used when :

- Low sequencing sample
- Required for some statistical methods to compare the samples in pairs

Exercise 8

Which values are interesting to test?

Exercise 8

1. Normalize your data from Affiliation based on the smallest samples

2. Normalize your data on 2000 sequences or less

3. Normalize your data on 8000 sequences

4. What differences with or without

Q1: Normalize your data from Affiliation based on this number of sequence

Thanks to Clusterstat output, you can know what is the size of the smallest sample.
Sort by **Total sequences** *i.e.* 7638 sequences

7638 is the maximal size that you can ask for normalizing the sample sizes.

207

Exemple of visualization in FigTree from nhx file
Practice:

Exercice:

1. Create the phylogenetic tree that will be used for statistical analyses.

For tutorial, we ask you to create a phylogentic tree on affiliation.biom **before** "**affiliation filter**" process. Otherwise on your own data, create the phylogenetic tree on cleaned affiliation.biom

Download your data

In order to share resources as well as possible, files that have not been accessed for more than 120 days are regularly purged. The backup of data generated using of Galaxy is <u>your responsibility</u>.

You have 2 backup possibilities:
1. Save your datasets one by one using the "floppy disk" icon.

2. Or export each history.
To export a history, from the "History" menu, click on the arrow, then "Export History to File":
