#### Abstract

**Motivation:** Metagenomics leads to major advances in microbial ecology and biologists need user friendly tools to analyze their data on their own. **Results:** This Galaxy-supported pipeline, called FROGS, is designed to analyze large sets of amplicon sequences and produce abundance tables of Operational Taxonomic Units (OTUs) and their taxonomic affiliation. The clustering uses Swarm... This chimera removal uses VSEARCH combined with original cross-sample validation. The affiliation output to highlight databases confusable graphical illustrations are produced along with original cross-sample validation. The pipeline is robust and highly sensitive. It compares to QIIME.

**Availability and implementation:** Source code: geraldinepascal/FROGS.git. A companion web: Contact: geraldine.pascal@inra.fr  
**Supplementary information:** Supplementary

#### 1 Introduction

The expansion of high-throughput sequencing of rRNA has opened new horizons for the study of microbial ecology by making it possible to study all micro-organisms in an environment without the need to cultivate them, leading to major advances in many fields of microbial ecology study of the impact of microbiota on human and animal

<sup>†</sup>Maria Bernard and Olivier Rué are joint first authors.

#### Abstract

Fungi are present in all environments. They fulfill important ecological functions and play a crucial role in the food industry. Their accurate characterization is thus indispensable, particularly through metabarcoding. The most frequently used markers to monitor fungi are ITSs. These markers are the best documented in public databases but have one main weakness: polymerase chain reaction amplification may produce non-overlapping reads in a significant fraction of the fungi. When these reads are filtered out, traditional metabarcoding pipelines lose part of the information and consequently produce biased pictures of the composition and structure of the environment under study. We developed a solution that enables processing of the entire set of reads including both overlapping and non-overlapping, thus providing a more accurate picture of fungal communities. Our comparative tests using simulated and real data demonstrated the effectiveness of our solution, which can be used by both experts and non-specialists on a command line or through the Galaxy-based web interface.

**Key words:** fungi; ITS; metabarcoding; workflow; amplicon; metagenomics

#### Introduction

Using amplicon sequencing to describe the microbial composition of an environment is a time saving and cost effective strategy and can be used even for very large-scale surveys [1]. Most studies currently focus on the bacterial fraction of microbial communities but the fungal fraction is equally important, as fungi are ubiquitous and provide several ecosystem services [2]. Unfortunately, studying the fungal fraction using metabarcoding has its own challenges. Indeed, in fungi, there is no equivalent of the 16S rDNA gene, which is widely used and highly suitable

for bacteria. The best candidates are internal transcribed spacers (ITS), but these are more difficult to manipulate. The main problem with ITS is size polymorphism, with a size range of 361–1475 bases in ITS1 and 7–11 kb (nucleotide 165 where 95% of the sequences have a length between 1205 and 1556 bases). Most studies describing ITS data analyses process either (i) paired-end reads but filter out non-overlapping, non-mergable reads, thus systematically discarding taxa with longer ITS, or (ii) single-end reads, thus limiting taxonomic resolution and losing the benefit of information contained in longer sequences [4, 5].

Maria Bernard is a bioinformatics engineer. She is a member of a platform team conducting NGS sequence analysis and designing software. She specializes in workflow development in particular for metabarcoding analysis.  
Olivier Rué is a bioinformatics engineer. He is in charge of data analysis at the Migale bioinformatics facility. He specializes in the analysis of metabarcoding and metagenomics data.  
Mahendra Mariadassou has a PhD in statistics. He is involved in the development of new statistical methods and tools for metabarcoding analysis.  
Géraldine Pascal has a PhD in bioinformatics and coordinates the FROGS project. She is currently involved in designing solutions for long read problems, workflow development and metagenomics analysis.

The user-friendly and Galaxy-supported pipeline FROGS analyzes large sets of DNA amplicon sequences accurately and rapidly, essential for microbial community studies.

- FROGS was designed to support multiplexed and demultiplexed sequences.
- FROGS supports ITS, 18S, 23S, 16S and other amplicon reads.
- FROGS supports short or long reads.
- The preprocessing step is dedicated to paired sequence merging, cleaning and denoising.
- The clustering step uses Swarm with a novel clustering threshold, not a global clustering threshold like other software.
- OTU removal step uses VSEARCH combined with an innovative chimera removal algorithm.
- A filtering step allows to remove rare OTUs.
- Attention tool returns taxonomic affiliation for each OTU using two methods with a unique multi-verification output.
- FROGS offers numerous tools for amplicon map (OTU).
- A lot of statistical results and numerous graphical customizations are also provided.
- FROGS is designed for independence thanks to its Galaxy interface, but is also available with command line tool.
- Its tool can be used independently, or as a workflow.
- To install FROGS, visit [frogs.toulouse.inrae.fr](http://frogs.toulouse.inrae.fr).

FROGS was tested on many datasets

- The "FROGS ITS Benchmark 16S" and "FROGS ITS Benchmark 16S" when compared between FROGS and other popular pipelines.

# Story of barcoding

---

- Early 2000's: beginning of barcoding
- 1<sup>st</sup> DNA barcode: 65 bases of the mitochondrial gene of Cytochrome Oxidase I (COI) dedicated to the identification of vertebrates
- 2007: 1<sup>st</sup> international published database
- 2009: chloroplastic markers - RBCL (Ribulose Biphosphate Carboxylase; 553 pairs of bases) and MATK (MATurase K; 879 pairs of bases) -> standard markers for plants
- 2012: ITS, standard marker of fungi (length between 361–1475 bases in UNITE 7.1)
- 16S marker, mainly used for bacteria but no designated standard.

# Which barcode ?

---

Microbial lineages vary in their genomic contents, which suggests that different genes might be needed to resolve the diversity within certain taxonomic groups.

- 16S rRNA
- 23S rRNA,
- DNA gyrase subunit B (*gyrB*),
- RNA polymerase subunit B (*rpoB*),
- TU elongation factor (*tuf*),
- DNA recombinase protein (*recA*),
- protein synthesis elongation factor-G (*fusA*),
- dinitrogenase protein subunit D (*nifD*),
- Internal Transcribed Spacer (ITS) for Fungi.

# The gene encoding the small subunit of the ribosomal RNA

---

The most widely used gene in **molecular phylogenetic** studies

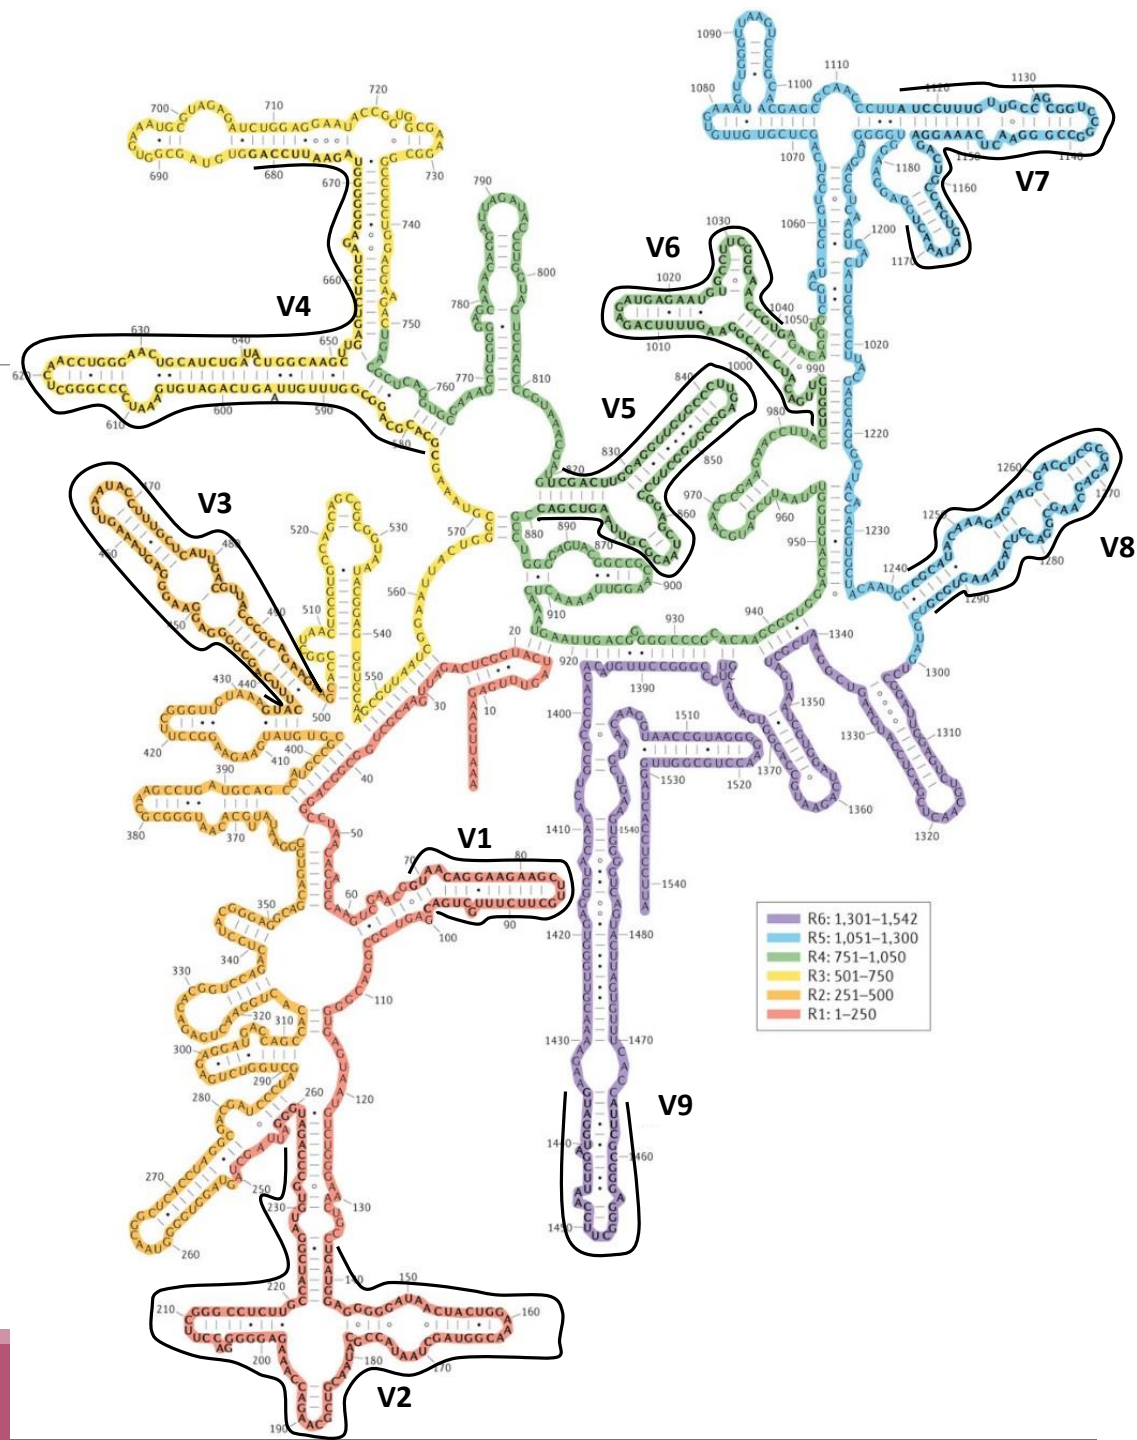

Ubiquist gene : **16S rDNA** in prokaryotes ; **18S rDNA** in eukaryotes

**Gene encoding a ribosomal RNA** : non-coding RNA (not translated), part of the small subunit of the ribosome which is responsible for the translation of mRNA in proteins

Not submitted to lateral gene transfer

Availability of databases facilitating comparison

(Silva v138.1 - 2021: available SSU/LSU sequences to over **10,700,000**)

# Steps for Illumina sequencing

- 1<sup>st</sup> step : one PCR

- 2<sup>nd</sup> step: one PCR

- 3<sup>rd</sup> step: on flow cell, the cluster generations

- 4<sup>th</sup> step: sequencing

# Cluster generation

## Prepare Genomic DNA Sample

Randomly fragment genomic DNA and ligate adapters to both ends of the fragments.

## Attach DNA to Surface

Bind single-stranded fragments randomly to the inside surface of the flow cell channels.

Attach DNA to surface

## Bridge Amplification

Add unlabeled nucleotides and enzyme to initiate solid-phase bridge amplification.

Bridge amplification

# Cluster generation

Fragments Become Double Stranded

The enzyme incorporates nucleotides to build double-stranded bridges on the solid-phase substrate.

Fragments become double stranded

Denature the Double-Stranded Molecules

Denaturation leaves single-stranded templates anchored to the substrate.

Denature the double-stranded molecule

Complete Amplification

Several million dense clusters of double-stranded DNA are generated in each channel of the flow cell.

Cycle of new strand synthesis and denaturation to make multiple copies of the same sequence (amplification)  
Reverse strands are washed

# Sequencing by synthesis

## Determine First Base

The first sequencing cycle begins by adding four labeled reversible terminators, primers, and DNA polymerase.

Light signal is more strong in cluster

## Image First Base

After laser excitation, the emitted fluorescence from each cluster is captured and the first base is identified.

## Determine Second Base

The next cycle repeats the incorporation of four labeled reversible terminators, primers, and DNA polymerase.

# Sequencing by synthesis

## Image Second Chemistry Cycle

After laser excitation, the image is captured as before, and the identity of the second base is recorded.

## Sequencing Over Multiple Chemistry Cycles

The sequencing cycles are repeated to determine the sequence of bases in a fragment, one base at a time.

Barcode is read, so cluster is identified.

After first sequencing (250 or 300 nt of Reverse strand), fragment form bridges again and Forward strand can be sequenced also.

↓ PCRs

Illumina index

Illumina adapter

Illumina adapter

↓ Sequencing

# Amplification and sequencing

---

Sequencing is generally performed on ~~Roche-454~~ or Illumina MiSeq platforms or Oxford Nanopore Technology or PACBIO platforms.

Read quantity: ~10 000 reads per sample (454), ~30 000 reads per sample (MiSeq), up to several Tera of data (ONT).

Sequence lengths: >650 bp (Roche-454), 2 x 250 bp or 2 x 300 bp (MiSeq), Longest read > 2Mb (ONT or PACBIO)

# Methods

---

# Exemple of FROGS Pipeline

**FROGS\_0 Demultiplex reads** Attribute reads to samples in function of inner barcode  
**FROGS\_1 Pre-process** merging, denoising and dereplication  
**FROGS\_2 Clustering swarm** Single-linkage clustering on sequences  
**FROGS\_Cluster\_Stat** Process some metrics on clusters  
**FROGS\_3 Remove chimera** Remove PCR chimera in each sample  
**FROGS\_4 Cluster filters** Filters clusters on several criteria.  
**FROGS ITSx** Extract the highly variable ITS1 and ITS2 subregions from ITS sequences  
**FROGS\_5 Taxonomic affiliation** Taxonomic affiliation of each ASV's seed by RDPtools and BLAST  
**FROGS\_6 Affiliation\_Stat** Process some metrics on taxonomies

### Basic tools

**FROGSSTAT Phyloseq Import Data** from 3 files: biomfile, samplefile, treefile  
**FROGSSTAT Phyloseq Composition Visualisation** with bar plot and composition plot  
**FROGSSTAT Phyloseq Alpha Diversity** with richness plot  
**FROGSSTAT Phyloseq Beta Diversity** distance matrix  
**FROGSSTAT Phyloseq Sample Clustering** of samples using different linkage methods  
**FROGSSTAT Phyloseq Structure Visualisation** with heatmap plot and ordination plot  
**FROGSSTAT Phyloseq Multivariate Analysis Of Variance** perform Multivariate Analysis of Variance (MANOVA)  
**FROGSSTAT DESeq2 Preprocess** import a Phyloseq object and prepare it for DESeq2 differential abundance analysis a  
**FROGSSTAT DESeq2 Visualisation** extract and visualise differentially abundant ASVs or functions

### Statistics tools

**FROGS Tree** Reconstruction of phylogenetic tree  
**FROGS Affiliation Filters** Filters ASVs on several affiliation criteria  
**FROGS Affiliation postprocess** Aggregates ASVs based on alignment metrics  
**FROGS Abundance normalisation** Normalise ASV abundance.

### Optional basic tools

**FROGS BIOM to std BIOM** Converts a FROGS BIOM in fully compatible BIOM  
**FROGS TSV\_to\_BIOM** Converts a TSV file in a BIOM file 1  
**FROGS BIOM to TSV** Converts a BIOM file in TSV file

### Utilities tools

**FROGSFUNC\_1\_placeseqs\_and\_copynumbers** Places ASVs into a reference phylogenetic tree.  
**FROGSFUNC\_2\_functions** Calculates functions abundances in each sample.  
**FROGSFUNC\_3\_pathways** Calculates pathway abundances in each sample.

### Functional inference tools

# FROGS Tools for Bioinformatics analyses

The screenshot displays the Galaxy Toulouse web interface. At the top, the navigation bar includes 'Workflow', 'Visualize', 'Données partagées', 'Aide', 'Utilisateur', and 'Using 313.8 MB'. The left sidebar contains a 'Tools' section with a search bar and an 'Upload Data' button. Below this is a list of tools under the heading 'Sequence Quality & Cleaning', including various FROGS tools like 'FROGS\_0 Demultiplex reads', 'FROGS\_1 Pre-process merging', 'FROGS\_2 Clustering swarm', etc.

The main content area shows a green notification box with a checkmark icon, indicating a successful execution: 'Executed FROGS Pre-process and successfully added 1 job to the queue.' It lists the input as '1: ITS1.tar.gz' and the outputs as '8: FROGS Pre-process: dereplicated.fasta', '9: FROGS Pre-process: count.tsv', and '10: FROGS Pre-process: report.html'. A note below states: 'You can check the status of queued jobs and view the resulting data by refreshing the History panel. When the job has been run the status will change from 'running' to 'finished' if completed successfully or 'error' if problems were encountered.'

On the right side, the 'History' panel shows a list of jobs with their status and size. The jobs are: '1: ITS1.tar.gz' (green), '2: metadata ITS.tsv' (red with error), '3: Galaxy2-[metadata\_chaillou.tsv].tsv' (green), '4: metadata ITS.tsv' (green), '5: metadata ITS.tsv' (red with error), '6: ITS1.tar.gz' (green), '7: metadata ITS.tsv' (red with error), '8: FROGS Pre-process: dereplicated.fasta' (green), '9: FROGS Pre-process: count.tsv' (green), and '10: FROGS Pre-process: report.html' (green).

Overlaid on the right side of the screenshot are four colored boxes representing job statuses: 'Waiting to run' (grey), 'Currently running' (orange), 'Result files' (green), and 'Echec process' (red).

Tool names with numbers to make it easier to link tools, especially basic tools.

MgArd0081	AGTCTGC

if index is in only at forward:  
tabular file with 2 columns  
sample names + barcodes

# Advices

For your own data

- Do not forget to indicate barcode sequence as they are in the fastq sequence file, especially if you have data multiplexed via the reverse strand.
- For the mismatch threshold, we advised you to let the threshold to 0, and if you are not satisfied by the result, try with 1. The number of mismatch depends on the length of the barcode, but often those sequences are very short so 1 mismatch is already more than the sequencing error rate.
- If you have different barcode lengths, you must demultiplex your data in different times beginning by the longest barcode set and used the "unmatched" or "ambiguous" sequence with smaller barcode and so on.
- If you have Roche 454 sequences in sff format, you must convert them with some program like [sff2fastq](#)

# Outputs

7: FROGS\_0 Demultiplex reads: report

6: FROGS\_0 Demultiplex reads: undemultiplexed.tar.gz

5: FROGS\_0 Demultiplex reads: demultiplexed.tar.gz

A tar archive is created by grouping one (or a pair of) fastq file per sample with the names indicated in the first column of the barcode tabular file.

1	2
#sample	count
ambiguous	0
MgArd0009	91
MgArd0017	166
MgArd0038	1208
MgArd0029	193
unmatched	245
MgArd0001	119
MgArd0081	246
MgArd0046	401
MgArd0054	243
MgArd0073	474
MgArd0062	1127

With barcode mismatches >1 sequence can correspond to several samples. Sequences that match at only one sample are affected to this sample but the others (ambiguous) are not re-affected to a sample.

Sequences without known barcode. So these sequences are non-affected to a sample.

# Format: Barcode

---

BARCODE FILE is expected to be **tabulated**:

- first column corresponds to the sample name (unique, without space)
- second to the forward sequence barcode used (None if only reverse barcode)
- optional third is the reverse sequence barcode (optional)

Take care to indicate sequence barcode in the strand of the read, so you may **need to reverse complement** the reverse barcode sequence. Barcode sequence must have the same length.

Example of barcode file.

The last column is optional, like this, it describes sample multiplexed by both fragment ends.

MgArd00001

ACAGCGT

ACGTACA

# Format : FastQ

---

FASTQ : Text file describing biological sequence in 4 lines format:

- first line start by "@" correspond to the sequence identifier and optionally the sequence description. "@Sequence\_1 description1"
- second line is the sequence itself. "ACAGC"
- third line is a "+" following by the sequence identifier or not depending on the version
- fourth line is the quality sequence, one code per base. The code depends on the version and the sequencer

```
@HNHOSKD01ALD0H
ACAGCGTCAGAGGGGTACCAGTCAGCCATGACGTAGCACGTACA
+
CCCFHHHHHHJJJJHHFF@DEDDDDDDDD@CDDDDACDD
```

# How it works ?

---

For each sequence or sequence pair the sequence fragment at the beginning (forward multiplexing) of the (first) read or at the end (reverse multiplexing) of the (second) read will be compared to all barcode sequences.

If this fragment is equal (with less or equal mismatch than the threshold) to one (and only one) barcode, the fragment is trimmed and the sequence will be attributed to the corresponding sample.

Finally fastq files (or pair of fastq files) for each sample are included in an archive, and a report describes how many sequences are attributed for each sample.

---

# 1-Preprocess tool

---

# What does the Pre-process tool do?

---

- Merging of R1 and R2 reads **with vsearch, flash or pear (only in command line)**
- Delete sequences without good primers
- Finds and removes adapter sequences **with cutadapt**
- Delete sequence with not expected lengths
- Delete sequences with ambiguous bases (N)
- Dereplication
  
- + removing homopolymers (size = 8 ) for 454 data
- + quality filter for 454 data

# How work reads merging ?

---

WITH VSEARCH

# The aim of Vsearch is to merge R1 with R2

---

Case of a sequencing of overlapping sequences: case of 16S V3-V4 amplicon MiSeq sequencing:

Imagine a real amplicon sequence of 400bp

400bp

Imagine a Miseq paired sequencing of 2x250bp

R1 : 250bp

R2 : 250bp

Reconstructing amplicon sequence is possible thanks to the overlap region

Merged sequence length : 400bp, with 100bp overlap

# The aim of Vsearch is to merge R1 with R2

---

Case of a sequencing of over-overlapping sequences:

Imagine a real amplicon sequence of 200bp

200bp

Imagine a Miseq paired sequencing of 2x250bp

R1 : 250bp

R2 : 250bp

FROGS takes in charge this case in trimming over bases

200bp

Merged sequence length : 200bp, with 100% overlap

---

# Practice:

---

# Exercise

---

Go to « [16S](#) » history

Launch the pre-process tool on that data set

→ objective: understand Vsearch software

# 16S dataset presentation:

---

A real analysis provided by Stéphane Chaillou *et al.*

Comparison of meat and seafood bacterial communities.

8 environment types (EnvType) :

- Meat → Ground Beef, Ground veal, Poultry sausage, Diced bacon
- Seafood → Cooked schrimps, Smoked salmon, Salmon filet, Cod filet

# 16S dataset presentation:

---

From Chaillou paper, we produced simulated data:

- 64 samples of 16S amplicons
- R1 and R2 overlapping reads of 300 bases.
- 8 replicates per condition
- with errors among the linear curve  $2.54e-1$   $2.79e-1$

- with 10% chimeras
- Primers for V1-V3:
  - 5' AGAGTTTGATCCTGGCTCAG 3'
  - 5' CCAGCAGCCGCGGTAAT 3'

Chaillou, S. et al (2015). Origin and ecological selection of core and food-specific bacterial communities associated with meat and seafood spoilage. ISME J, 9(5):1105-1118.

**Sequencer**

Illumina

Select the sequencing technology used to produce the sequences.

**Input type**

TAR Archive

Samples files can be provided in a single TAR archive or sample by sample (with one or two files each).

**TAR archive file** 1: chaillou\_withprimers\_64renamedsamples\_V1V3\_10000seq\_R1R2.tar.gz

The TAR file containing the sequences file(s) for each sample.

**Are reads already merged ?**

No

Yes = The archive contains 1 file by sample : R1 and R2 pairs are already merged in one sequence.

**Reads 1 size**

300

The maximum read1 size.

**Reads 2 size**

300

The maximum read2 size.

**Mismatch rate**

0.1

The maximum rate of mismatches in the overlap region (--mismatch-rate)

**Merge software**

Vsearch

Select the software to merge paired-end reads (--merge-software)

**Would you like to keep unmerged reads?**

- No, unmerged reads will be excluded.  
 Yes, unmerged reads will be artificially combined.

No = Unmerged reads will be excluded; Yes = unmerged reads will be artificially combined with 100 N. (default No) (--keep-unmerged)

Vsearch is recommended (in command line, prefer pear)

**Minimum amplicon size**

400

The minimum size of the amplicons (with primers) (--min-amplicon-size)

**Maximum amplicon size**

580

The maximum size of the amplicons (with primers) (--max-amplicon-size)

**Do the sequences have PCR primers?**

Yes  
 No

**5' primer**

AGAGTTTGATCCTGGCTCAG

The 5' primer sequence (wildcards are accepted). This primer must be written in 5' to 3' orientation (see details in 'Primers parameters' help section) (--five-prim-primer)

**3' primer**

CCAGCAGCCGCGTAAT

The 3' primer sequence (wildcards are accepted). This primer must be written in 5' to 3' orientation (see details in 'Primers parameters' help section) (--three-prim-primer)

**Minimum amplicon size**

400

The minimum size of the amplicons (with primers) (--min-amplicon-size)

**Maximum amplicon size**

580

The maximum size of the amplicons (with primers) (--max-amplicon-size)

**Do the sequences have PCR primers?**

Yes  
 No

# Exercise

---

1. Do you understand how enter your primers ?
2. What is the « FROGS Pre-process: dereplicated.fasta » file ? 
3. What is the « FROGS Pre-process: count.tsv » file ? 
4. Explore the file « FROGS Pre-process: report.html » 
5. *Who loose a lot of sequences ?*

# Exercise

---

6. How many sequences are there in the input file ?
7. How many sequences did not have the 5' primer?
8. How many sequences still are after pre-processing the data?
9. How much time did it take to pre-process the data ?
10. What is the length of your merged reads before preprocessing ?
11. What can you tell about the samples, based on amplicon size distributions ?

## Q1: Do you understand how enter your primers ?

**Minimum amplicon size**

The minimum size for the amplicons (with primers).

**Maximum amplicon size**

The maximum size for the amplicons (with primers).

**Sequencing protocol**

The protocol used for sequencing step: standard or custom with PCR primers as sequencing primers.

**5' primer**

The 5' primer sequence (wildcards are accepted). The orientation is detailed below in 'Primers parameters' help section.

**3' primer**

The 3' primer sequence (wildcards are accepted). The orientation is detailed below in 'Primers parameters' help section.

    raise exception
Exception:
#ERROR : The filters have eliminated all sequences (see summary for more details).
```

If your outputs are red, click on the bug to read the error message

it is likely that you did not enter the 3' primer in the right direction

## Answer 5

All outputs are green  
but check the  
report.html

5: FROGS\_1 Pre-process: report.html

4: FROGS\_1 Pre-process: count.tsv

3: FROGS\_1 Pre-process: dereplicated.fasta

Error in 3' primer sequence.  
Primers must be similar with 10% of  
errors (~1 or 2 bases per primer)

### Sequencer

Illumina

Select the sequencing technology used to produce the sequences.

### Input type

TAR Archive

Samples files can be provided in a single TAR archive or sample by sample (with one or two files each).

### TAR archive file

1: chaillou\_withprimers\_64renamedsamples\_V1V3\_10000seq\_R1R2.tar.gz

The TAR file containing the sequences file(s) for each sample.

### Are reads already merged ?

No

Yes = The archive contains 1 file by sample : R1 and R2 pairs are already merged in one sequence.

### Reads 1 size

300

The maximum read1 size.

### Reads 2 size

300

The maximum read2 size.

### Mismatch rate

0.1

The maximum rate of mismatches in the overlap

### Merge software

Vsearch

Select the software to merge paired-end reads

### Would you like to keep unmerged reads?

- No, unmerged reads will be excluded.
- Yes, unmerged reads will be artificially combined.

No = Unmerged reads will be excluded; Yes = unmerged reads will be artificially combined with 100 N. (default No) (--keep-unmerged)

if your sequences have low qualities, you can increase this parameter  
But careful !

To check the sequence quality use FASTQC (present in galaxy tools)

### Tools

fastqc

Upload Data

Show Sections

### FastQC Read Quality reports

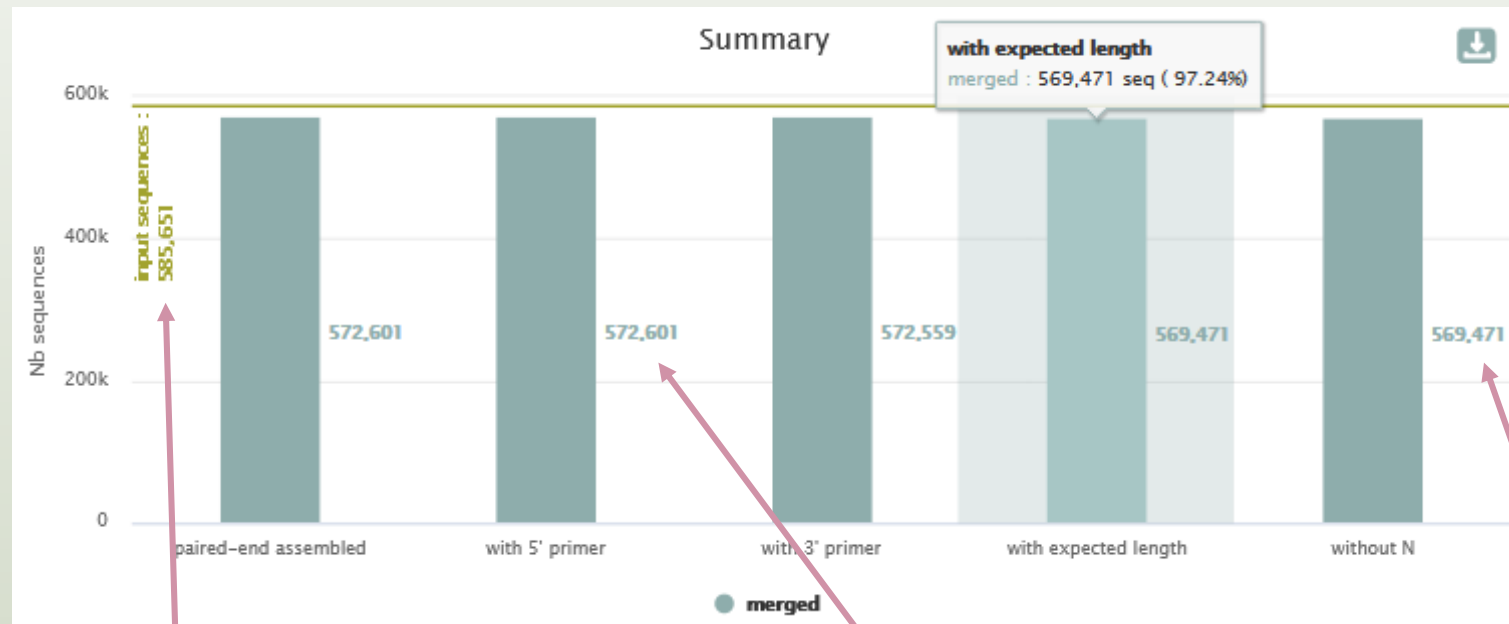

Answer 6, 7 & 8

Q6: How many sequences are there in the input file ?

Q7: How many sequences did not have the 5' primer?

Q8: How many sequences still are after pre-processing the data?

Total number of sequences before preprocessing: 585 651

All sequences have the 5' primer

569 471 sequences are still after preprocessing

## Answer 9

Q9: How much time did it take to pre-process the data ?

### 3: FROGS\_1 Pre-process: dereplicated.fasta

287,403 sequences

format: **fasta**, génome de référence: ?

## Application

Software: preprocess.py (version: 4.1.0)

```
Command: /galaxydata/galaxy2021/galaxy02/galaxy/database
/dependencies/_conda/envs/mulled-
v1-916ab06f682ad01c3fd3dce3cb781eab380d0e2ea46de6f24ab32102bee

at the bottom of the table

# Answer 10

## Q10: What is the length of your merged reads before preprocessing ?

Amplicons lengths

Amplicons lengths

Before the preprocessing,  
 $400 < \text{sequence length} < 555$

After the preprocessing, the  
sequences were shortened

Q11: What can you tell about the samples, based on amplicon size distributions ?

« Filet Cabillaud » samples

« Saumon Fumé » samples

« Bœuf Haché » samples

For each EnvType, we can observe different amplicon sizes. They correspond to different species.

*N.B.* amplicons with same size can represent different species.

---

# 2-Clustering tool

---

# Why do we need clustering ?

---

Amplification and sequencing are not perfect processes

- Polymerase error during PCR?
- Sequencing errors ?
- Natural variations ?

Expected

Natural variability?  
Technical noise?  
Contaminant?  
Chimeras?

Expected

Results

Natural variability ?  
Technical noise?  
Contaminant?  
Chimeras?

16S variability  
Cf. RRNDB (ribosomal RNA operons database)  
<https://rrndb.umms.med.umich.edu/search/>  
max. 21 copies of 16S in bacteria (*Photobacterium damsela*)  
ex. *E. coli* 7 copies

# To have the best accuracy:

Method: All against all

- Very accurate
- Requires a lot of memory and/or time

=> Impossible on very large datasets without strong filtering or sampling

# How traditional clustering works ?

---

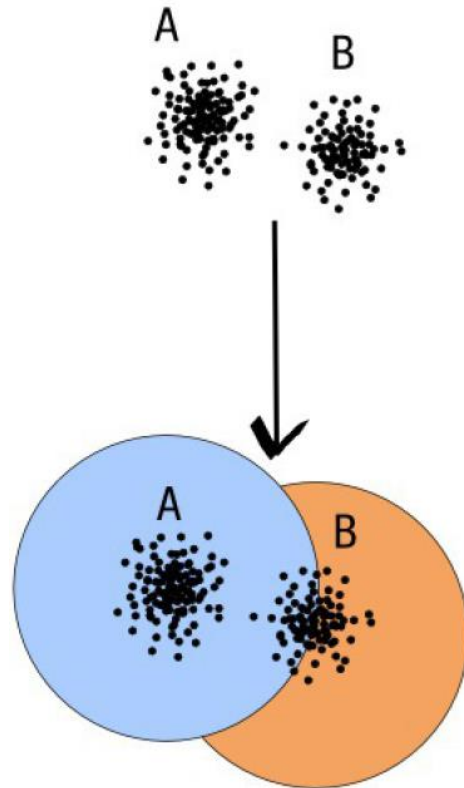

# Input order dependent results

---

decreasing length,  
decreasing abundance,  
external references

# Single a priori clustering threshold

compromise threshold  
unadapted threshold

natural limits of clusters

# Swarm clustering method

# Comparison Swarm and 3% clusterings

---

Radius expressed as a percentage of identity with the central amplicon (97% is by far the most widely used clustering threshold)

# Comparison Swarm and 3% clusterings

More there is sequences, more abundant clusters are enlarged (more amplicon in the cluster).  
More there are sequences, more there are artefacts

**FROGS\_2 Clustering swarm** Single-linkage clustering on sequences  
(Galaxy Version 4.1.0+galaxy1)

☆ Favorite    🔄 Versions    ▼ Options

**Sequences file**

3: FROGS\_1 Pre-process: dereplicated.fasta

The dereplicated sequences file (format: FASTA)

**Count file**

4: FROGS\_1 Pre-process: count.tsv

It contains the count by sample for each sequence (format: TSV)

**FROGS guidelines version**

New guidelines from version 3.2

The denoising step before a d3 clustering is no longer recommended since FROGS 3.2, but you can still choose it.

**Aggregation distance clustering**

1

Maximum number of differences between sequences in each aggregation Swarm step. (recommended d=1) (--distance)

**Refine clustering**

Yes, refine clustering with --fastidious swarm option  
 No, perform clustering without refinement

Clustering will be performed with the Swarm --fastidious option. It is recommended and only usable in association with a distance of 1 (default and recommended: Yes) (--fastidious)

longer but more accurate

---

LAUNCH CLUSTERING AND CLUSTERSTAT TOOLS

# Exercise

---

Go to « 16S » history

Launch the Clustering SWARM tool on that data set with guideline 3.2 *i.e. aggregation distance =1*

→ objectives :

- understand the outputs from clustering
- understand the ClusterStat utility

# Exercise

---

1. How many clusters do you get ?

Launch FROGS **Cluster Stat tools** on the previous abundance biom file

FROGS Clusters stat Process  
some metrics on clusters.

# Exercise

---

2. Interpret the boxplot: **Clusters size summary**
3. Interpret the table: **Clusters size details - How many single singletons do you find?**
4. What can we say by observing the **sequence distribution**?
5. How many clusters share “BHT0.LOT08” with at least one other sample?
6. How many clusters could we expect to be shared ?
7. How many sequences represent the 106 specific clusters of “CDT0.LOT06”?
8. This represents what proportion of “CDT0.LOT06”?
9. What do you think about it?
10. How do you interpret the « Hierarchical clustering » ?

Answer 1, 2  
& 3

Q1: How many clusters do you get ?

Q2: Interpret the boxplot: **Clusters size summary**

Q3: Interpret the table: **Clusters size details** -  
**How many single singletons do you find?**

Most of clusters are singletons

Answer 4

Q4: What can we say by observing the **sequence distribution**?

The small clusters represent few sequences

Answer 5 to 9

	Total clusters	Shared clusters	Own clusters	Total sequences	Shared sequences	Own sequences
BHT0.LOT01	493	114	379	9,089	8,709	380
BHT0.LOT03	433	140	293	8,915	8,630	285
BHT0.LOT04	474	152	322	8,937	8,630	307
BHT0.LOT05	475	152	323	8,937	8,630	307
BHT0.LOT06	490	156	334	8,996	8,662	334
BHT0.LOT07	531	165	366	9,059	8,690	369
BHT0.LOT08	430	201	229	8,715	8,486	229
BHT0.LOT10	477	152	325	8,937	8,630	307
CDT0.LOT02	511	100	411	9,270	8,767	503
CDT0.LOT04	513	100	413	8,918	8,609	309
CDT0.LOT05	384	241	143	8,520	8,377	143
CDT0.LOT06	365	256	109	8,373	8,264	109
CDT0.LOT07	512	100	412	9,270	8,767	503
CDT0.LOT08	556	162	394	9,270	8,767	503

201 clusters of BHT0.LOT08 are common at least once with another sample

~30 % of the specific clusters of CDT0.LOT06 represent around ~1% of sequences  
 Could be interesting to remove if individual variability is not the concern of user

Q5: How many clusters share "BHT0.LOT08" with at least one other sample?  
 Q6: How many clusters could we expect to be shared ?  
 Q7: How many sequences represent the 106 specific clusters of "CDT0.LOT06"?  
 Q8: This represents what proportion of "CDT0.LOT06"?  
 Q9: What do you think about it?

Q10: How do you interpret the « Hierarchical clustering » ?

The « Hierarchical clustering » is established with a Bray Curtis distance particularly well adapted to abundance table of very heterogenous values (very big and very small figures).

Newick tree available too, can be copied and pasted an tree viewer

```

Answer 10

Q10: How do you interpret the « Hierarchical clustering » ?

N.B.: Hierarchical clustering is not all a phylogenetic tree ! Please consult with caution.

---

# 3-Chimera removal tool

---

# What is chimera ?

PCR-generated chimeras are typically created when an aborted amplicon acts as a primer for a heterologous template. Subsequent chimeras are about the same length as the non-chimeric amplicon and contain the forward (for.) and reverse (rev.) primer sequence at each end of the amplicon.

**Chimera: from 5 to 45% of reads** (Haas 2011  
doi: 10.1101/gr.112730.110)

Fichot and Norman *Microbiome* 2013 **1**:10  
doi:10.1186/2049-2618-1-10

*aborted amplification*

*next cycle's "primer"*

*chimeric sequence*

# A smart removal chimera to be accurate

We use a sample cross-validation

Sample A

Sample B

“d” is view as chimera by Vsearch  
Its “parents” are presents

“d” is view as normal sequence by Vsearch because it have not “parents”.

- ⇒ For FROGS “d” is not a chimera
- ⇒ For FROGS “g” is a chimera, “g” is removed
- ⇒ FROGS increases the detection specificity

---

# Practice:

---

LAUNCH THE REMOVE CHIMERA TOOL

# Exercise

---

Go to « 16S » history

Launch the « FROGS\_3 Remove Chimera » tool

Follow by the « FROGS ClusterStat » tool

→ objectives :

- understand the efficiency of the chimera removal
- make links between small abundant ASVs and chimeras

**FROGS\_3 Remove chimera** Remove PCR chimera in each sample (Galaxy Version 4.1.0+galaxy1)

**Sequences file (format: FASTA)**

6: FROGS\_2 Clustering swarm: seed\_sequences.fasta

The sequences file

**Abundance type**

BIOM file

Select the type of file where the abundance of each sequence by sample is stored.

**Abundance file (format: BIOM)**

7: FROGS\_2 Clustering swarm: clustering\_abundance.biom

It contains the count by sample for each sequence.

# Exercise

---

1. Understand the « FROGS remove chimera : report.html»
  - a. How many clusters are kept after chimera removal?
  - b. How many sequences that represent ? So what abundance?
  - c. What do you conclude ?
2. What is the size of the largest removed cluster of chimeras?
3. Compare the HTML files
  - a. Of what are mainly composed singleton ? (compare with previous report.html)
  - b. What are their abundance?
  - c. What do you conclude ?

Q1a: How many clusters are kept after chimera removal?  
 Q1b: How many sequences that represent ? So what abundance?  
 Q1c: What do you conclude ?

## Remove summary

6023 clusters are kept.  
 The 14015 removed clusters  
 represent ~2.5 % of sequences

Here, chimera clusters  
 represent many clusters ~70%  
 but very few sequences.

Removed clusters are low  
 abundance clusters.

Answer 2

Q2: What is the size of the largest removed cluster of chimeras?

Sample	Clusters kept	% Clusters kept	Cluster abundance kept	% Cluster abundance kept	Chimeric clusters removed	Chimeric abundance removed	Abundance of the most abundant chimera removed	Individual chimera detected	Individual chimera abundance detected	Abundance of the most abundant individual chimera detected
VHT0.LOT02	205	35.90	8,862			410	19	372	446	19
MVT0.LOT10	254	60.48	9,313			180	10	169	304	92
VHT0.LOT08	261	45.87	8,852			332	10	310	344	11
VHT0.LOT01	198	35.42	8,832	95.90	361	378	8	365	382	8

The largest cluster of chimeras contained 19 sequences.

92 chimeras are detected but only 10 are removed because 82 have been invalidated by the cross validation

### Answer 3

Q3a: Of what are mainly composed singleton ? (compare with previous report.html)

Q3b: What are their abundance?

Q3c: What do you conclude ?

Cluster size	↑↓	Number of cluster	↑↓	% of all clusters
1		19,267		96.15
2		150		0.75
3		22		0.11
4		10		0.05

Cluster\_Stat report  
after clustering

Most small clusters  
are composed of  
chimeras

Cluster size	↑↓	Number of cluster	↑↓	% of all clusters
1		5,387		89.44
2		49		0.81
3		15		0.25
4		7		0.12

Cluster\_Stat report after  
chimera removing

---

# 4- Cluster Filter tool

---

# 4- Cluster Filter

---

**Goal:** This tool deletes clusters among conditions enter by user. If an cluster reply to at least 1 criteria, the cluster is deleted.

**Criteria:**

**The cluster prevalence:** The number of times the cluster is present in the environment, *i.e.* the number of samples where the cluster must be present.

**Cluster size:** An cluster that is not large enough for a given proportion or count will be removed.

**Biggest Cluster :** Only the X biggest are conserved.

**Contaminant:** If cluster sequence matches with phiX, chloroplastic/mitochondrial 16S of *A. Thaliana* or your own contaminant sequence.

## One tool, 4 criteria

## Sequence file

The sequence file to filter (format: FASTA)

## Abundance file

The abundance file to filter (format: BIOM)

## Minimum prevalence method

## Minimum prevalence

Fill the field only if you want this treatment. Keep cluster if it is present in at least this number of samples.

## Minimum cluster abundance as proportion or count. We recommend to use a proportion of 0.00005.

## Minimum proportion of sequences abundance to keep cluster

Fill the field only if you want this treatment. Example: 0.00005, recommended by Bokulich et al 2013, to keep cluster with at least 0.005% of all sequences (--min\_abundance)

## N biggest clusters

Fill the fields only if you want this treatment. Keep the N biggest clusters (--nb-biggest-clusters)

## Search for contaminant clusters.

Either you use your own contaminant fasta file or you select one among available ones. (--contaminant)

1

# Prevalence filter – option 1

**FROGS\_4 Cluster filters** Filters clusters on several criteria. (Galaxy Version 4.1.0+galaxy1) ☆ Favorite ▼ Options

**Sequences file**

📁

The sequence file to filter (format: FASTA)

**Abundance file**

📁

The abundance file to filter (format: BIOM)

**Minimum prevalence method**

▼

**Minimum prevalence**

Here, user wants that each cluster are present in at least 4 samples.

Fill the field only if you want this treatment. Keep OTU if it is present in at least this number of samples.

1

# Prevalence filter – option 2

**FROGS\_4 Cluster filters** Filters clusters on several criteria. (Galaxy Version 4.1.0+galaxy1) Favorite Options

**Sequences file**  
9: FROGS Remove chimera: non\_chimera.fasta  
The sequence file to filter (format: FASTA)

**Abundance file**  
10: FROGS Remove chimera: non\_chimera\_abundance.biom  
The abundance file to filter (format: BIOM)

**Minimum prevalence method**  
replicate identification Need to know group composition

**File of replicated sample names**  
12: chaillou\_replicate\_information.tsv  
Replicate file to link each sample to its group (cf. Help section).

**Minimum prevalence**  
0.5  
Fill the field only if you want this treatment. Keep OTU present in at least this proportion of replicates in at least one group (must be a proportion between 0 and 1).

Here, user wants that each cluster of its group to be present in at least half of samples making up the group

1

# Prevalence filter – option 2

## How to build the file of replicated sample names ?

The file must consist of **only 2 columns**, separated by a tab.

The first column contains **the exact names of the samples** (exactly those contained in the biom file)

The second column contains the name of the group to which they belong. Please note that group names must **not contain accents, spaces or special characters**.

Example:

```
sample1    rich
sample2    rich
sample3    rich
sample4    richAB
sample5    richAB
sample6    richAB
sample7    richAB
sample8    richAB
sample9    low
sample10   lowAB
sample11   lowAB
sample12   april21
sample13   april21
```

Thanks to get data tool,  
add it in your history

1

# Prevalence filter – option 2

## Results:

if we want to keep the clusters that are present in at least 50% of the samples of a same group, we set the threshold at 0.5.

The process will therefore keep the clusters present in at least

2 "rich" samples

3 "richAB" samples,

1 "lowAB" sample

1 "april21" sample

sample1	rich
sample2	rich
sample3	rich
sample4	richAB
sample5	richAB
sample6	richAB
sample7	richAB
sample8	richAB
sample9	low
sample10	lowAB
sample11	lowAB
sample12	april21
sample13	april21

and all clusters in sample9 since it is the only representative of the "low" condition.

1

# Prevalence filter – option 2

mistakes not to be made:

```
sample1 rich
sample2 rich
sample3 rich
sample4 richAB
sample5 richAB
sample6 richAB
sample7 richAB
sample8 low
sample9 lowAB
sample10 lowAB
sample11 lowAB
sample12 april21
sample13 april21
```

valid

```
sample1 rich
sample2 rich
sample 3 rich
sample4 richAB
sample5 richAB
sample6 richAB
sample7 richAB
sample8 low
sample9 lowAB
sample10 lowAB
sample11 lowAB
sample12 april21
sample13 april21
```

Creates artificially 3 columns

```
sample1 rich
sample2 rich
sample3 rich
sample4 rich AB
sample5 richAB
sample6 richAB
sample7 richAB
sample8 low
sample9 lowAB
sample10 lowAB
sample11 lowAB
sample12 april21
sample13 april21
```

Creates artificially 3 columns

2

# Cluster size filter

Minimum cluster abundance as proportion or count. We recommend to use a proportion of 0.00005.

as proportion

Minimum proportion of sequences abundance to keep cluster

5e-05

Fill the field only if you want this treatment. Example: 0.00005, recommended by Bokulich et al 2013, to keep cluster with at least 0.005% of all sequences (--min\_abundance)

OR

Minimum cluster abundance as proportion or count. We recommend to use a proportion of 0.00005.

as count

Minimum number of sequences to keep cluster

2

Fill the field only if you want this treatment. Ex: 2 to keep cluster with at least 2 sequences, so remove single singleton (--min\_abundance)

Here, user wants that each cluster has an abundance representing at least 0.005% of total number of sequences (*i.e.* 0.00005).

Here, user wants that each cluster has an abundance at least equals to 2 sequences -> single singleton will be removed.

3

# Filter : Keep biggest cluster

---

**N biggest clusters**

Fill the fields only if you want this treatment. Keep the N biggest clusters (--nb-biggest-clusters)

Here, user wants to keep the 50 biggest clusters.

4

# Contaminant filter

Search for contaminant clusters.

Use contaminant FASTA file from the server

Either you use your own contaminant fasta file or you select one among available ones. (--contaminant)

Contaminant databank

phiX

Remove phiX sequence (use as buffer while sequencing)

For example the phiX databank (the phiX is a control added in Illumina sequencing technologies).

OR

Search for contaminant clusters.

Use contaminant FASTA file from the server

Either you use your own contaminant fasta file or you select one among available ones. (--contaminant)

Contaminant databank

Arabidopsis TAIR10 Chloroplast and mitochondria

Remove chloroplastic and mitochondrial 16S sequences of *A. Thaliana*

For example the phiX databank (the phiX is a control added in Illumina sequencing technologies).

OR

Search for contaminant clusters.

Use contaminant FASTA file from the history

Either you use your own contaminant fasta file or you select one among available ones. (--contaminant)

Select a contaminante reference from history

18: contaminant.fasta

Add in your history (with getadata tool) your own file of contaminant sequences in fasta format.

---

# Practice:

---

LAUNCH THE CLUSTER FILTER TOOL

# Exercise:

---

Go to history « 16S » history

Launch « cluster Filter » tool with non\_chimera\_abundance.biom, non\_chimera.fasta

Use 3 criteria to filter clusters:

- cluster must be present at least in 4 samples
- Each cluster must represented a minimum of 0.005 % = 0.00005 <sup>(1)</sup> of the totality of the sequences
- cluster of phiX <sup>(2)</sup> must be removed

→ objective : play with filters, understand their impacts on false-positives clusters

<sup>(1)</sup> *Nat Methods*. 2013 Jan;10(1):57-9. doi: 10.1038/nmeth.2276. Epub 2012 Dec 2.  
**Quality-filtering vastly improves diversity estimates from Illumina amplicon sequencing.**  
Bokulich NA1, Subramanian S, Faith JJ, Gevers D, Gordon JI, Knight R, Mills DA, Caporaso JG.

<sup>(2)</sup> <https://www.illumina.com/products/by-type/sequencing-kits/cluster-gen-sequencing-reagents/phix-control-v3.html>

# Exercise:

---

1. What are the output files of “cluster Filter” ?
2. Explore “FROGS Filter : report.html” file. How many cluster have you removed ? How many cluster do they remain ? Which sample keeps the least cluster and for which reason?
3. Build the Venn diagram on the two filters. How many cluster have you removed with each filter ?
4. How many own cluster remains in BHT0.LOT08 ? To retrieve this information, which tool do you need to launch previously ?

Answer 1

FROGS\_4 Cluster filters Filters clusters on several criteria. (Galaxy Version 4.1.0+galaxy1)

### Sequence file

10: FROGS\_3 Remove chimera: non\_chimera.fasta

The sequence file to filter (format: FASTA)

### Abundance file

11: FROGS\_3 Remove chimera: non\_chimera\_abundance.biom

The abundance file to filter (format: BIOM)

### Minimum prevalence method

all samples

### Minimum prevalence

4

Fill the field only if you want this treatment. Keep cluster if it is present in at least this number of samples.

### Minimum cluster abundance as proportion or count. We recommend to use a proportion of 0.00005.

as proportion

### Minimum proportion of sequences abundance to keep cluster

0.00005

Fill the field only if you want this treatment. Example: 0.00005, recommended by Bokulich et al 2013, to keep cluster with at least 0.005% of all sequences (--min\_abundance)

### Keep N biggest clusters

Fill the fields only if you want this treatment. Keep the N biggest clusters (--nb-biggest-clusters)

### Search for contaminant clusters.

Use contaminant FASTA file from the server

Either you use your own contaminant fasta file or you select one among available ones. (--contaminant)

### Contaminant databank

phiX

For example the phiX databank (the phiX is a control added in Illumina sequencing technologies).

Outputs

17: FROGS\_4 Cluster filters: report.html

16: FROGS\_4 Cluster filters: excluded.tsv

15: FROGS\_4 Cluster filters: clusterFilters\_sequences.fasta

14: FROGS\_4 Cluster filters: clusterFilters\_abundance.biom

0.005% = 0.00005

CDT0.LOT07	190	99	90	91	0
SFT0.LOT05	215	105	108	109	0

*i.e.* this sample has only very small clusters that are shared by very few other samples.

## Filters intersections

Draw a Venn to see which ASVs had been deleted by the filters chosen (Maximum 6 options):

- Present in less than 4 samples
- Abundance < 0.005% (i.e 28 sequences )
- Present in databank of contaminants

Venn

### Venn on removed ASVs

- No phiX sequence.
- Most clusters are both small and not shared by 4 samples.

## Answer 4

report.html of ClusterStat tool

Because of the "prevalence = 4" criterion, there is no longer an "own cluster" for any sample.

---

OTU → ASV

---

# A long-standing discussion

---

The ASV vs OTU debate launched by the arrival of dada2 is not so new and had been bothering us for several months/years.

In fact, the debate largely preceded the term "ASV", and is precisely what made us opt for Swarm in FROGS (just under 10 years ago).

To quote the author of swarm:

“The traditional term "OTU" is negatively charged nowadays. The ASV vs OTU debate is creating confusion in the community and some users now think that all methods producing "OTUs" use a fixed clustering threshold (i.e. 97%-similarity) and are inherently bad. Of course, this is not the case and there are several methods published before the ASV term was coined that produce ASV-like clusters, swarm included.” To avoid that confusion, swarm's manual now only uses the generic term "cluster".

<https://github.com/torognes/swarm/commit/0bb491f9bf646c22a5363c27dc31a6d4b2ad335d> “

# A question of vocabulary

---

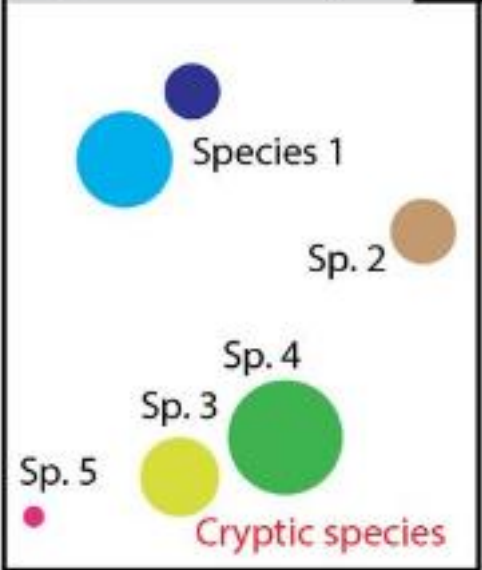

A few years ago, the **semantic problem was the opposite**, and any method that didn't produce OTUs was questioned or even disqualified.

At the start of FROGS, we therefore chose to call our clusters "OTUs" at the end of the analysis (once the filters had been applied), but it's only a question of vocabulary, and the **clusters produced by FROGS/swarm are very close to ASV in their construction**.

In any case, they look much more like ASVs than "fixed threshold" OTUs. The best thing would have been to use a new term, but **Frédéric Mahé** didn't make that choice at the time introducing **a new term** could have led to **confusion**.

Since version 4.1.0 of FROGS, we have changed our vocabulary and all OTU terms have been changed to **cluster** or **ASV** in FROGS tools and outputs.

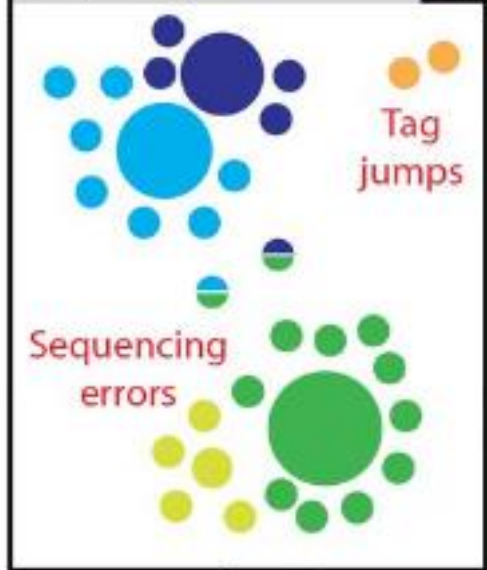

A) Bulk sample PCR

B) Amplicons HTS

C) Sequences Bio inf.

D) OTUs 97%

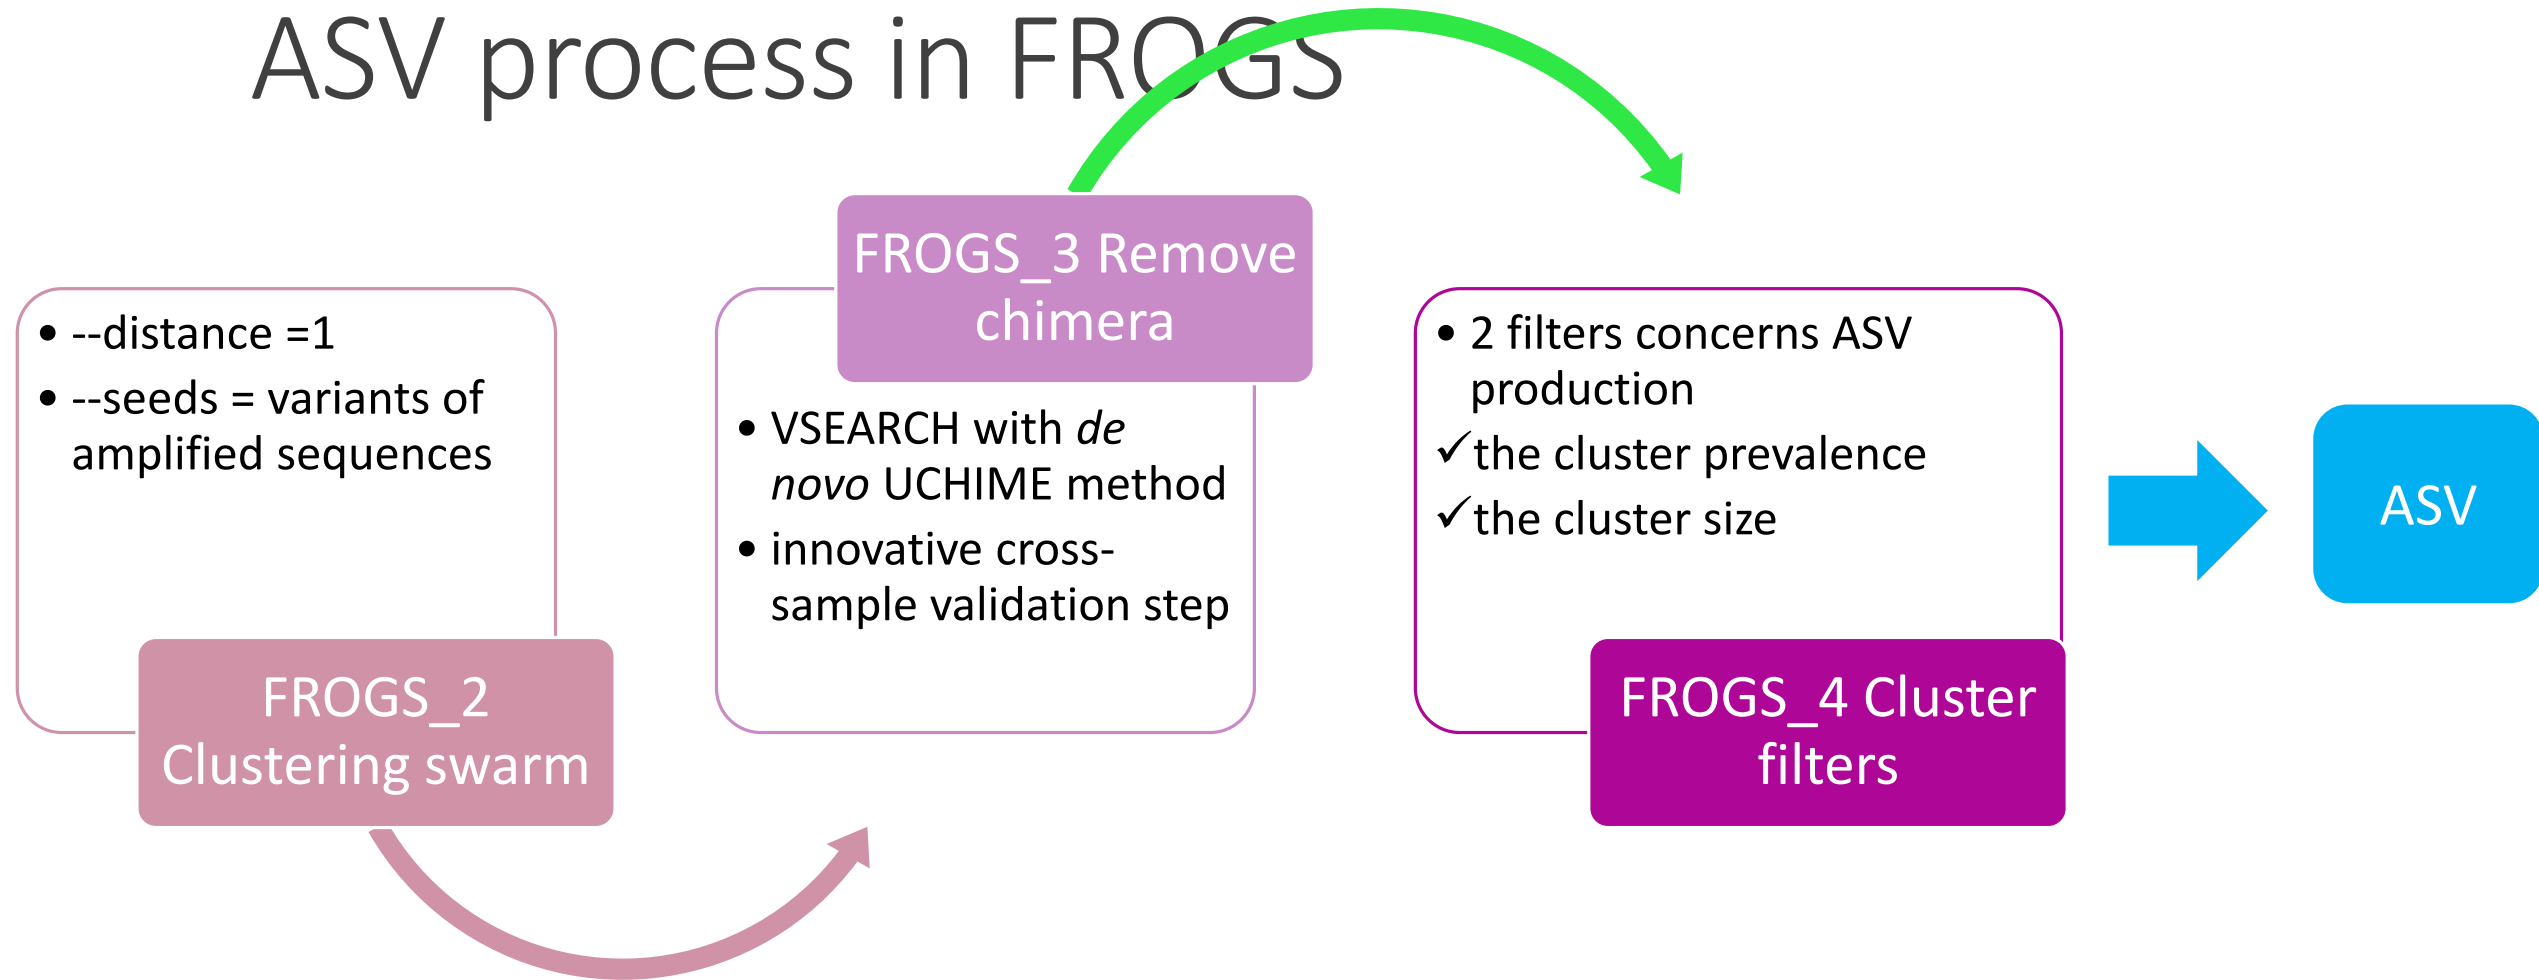

ASV by  
dada2 or  
FROGS

Denoising

# ASV process in FROGS

Swarm --seeds produces:  
variants of amplified sequences.

“Variants” because the output sequences are all different; but with no constraints on the extent of variation - one nucleotide to infinity.

LAUNCH THE FROGS\_5 TAXONOMIC AFFILIATION TOOL

# Exercice:

---

Go to history « 16S » history

Launch the « FROGS\_5 taxonomic affiliation » tool with

- SILVA 138.1 16S database **pintail 100**

→ objectives :

- understand abundance tables columns
- understand the BLAST affiliation

**FROGS\_5 Taxonomic affiliation** Taxonomic affiliation of each ASV's seed by RDPtools and BLAST (Galaxy Version 4.1.0+galaxy1)

☆ Favorite

▼ Options

#### Using reference database

16S SILVA 138.1\_pintail100

Select reference from the list

#### Also perform RDP assignment?

- Yes  
 No

Taxonomy affiliation will be perform thanks to Blast. This option allows to perform it also with RDP classifier tool (default No) (--rdp)

#### Taxonomic ranks

Domain Phylum Class Order Family Genus Species

The ordered taxonomic rank levels stored in BIOM. Each rank is separated by one space (--taxonomic-ranks)

#### Sequence file

15: FROGS\_4 Cluster filters: clusterFilters\_sequences.fasta

The sequences to affiliated (format: FASTA)

#### Abundance file

14: FROGS\_4 Cluster filters: clusterFilters\_abundance.biom

The abundance file (format: BIOM)

# Exercise

---

1. What are the « **FROGS\_5 taxonomic affiliation tool** » output files ?
2. How many sequences are affiliated by BLAST ?
3. How many ASV have a “multiaffiliation” at Order ranks ?
4. Click on the « eye » button on the BIOM output file, what do you understand ?

# Exercise

Use the **Biom\_to\_TSV** tool on this last file and click again on the "eye"  on the new output generated.

**FROGS BIOM to TSV** Converts a BIOM file in TSV file (Galaxy Version 4.1.0+galaxy1)

**Abundance file**  
20: FROGS\_5 Taxonomic affiliation: affiliation\_abundance.biom

The BIOM file to convert (format: BIOM)

**Sequences file (optional)**  
15: FROGS\_4 Cluster filters: clusterFilters\_sequences.fasta

The sequences file (format: fasta). If you use this option the sequences will be add in TSV.

**Extract multi-alignments**  
 Yes  
 No

If you have used FROGS\_5\_tax

alignments in a second TSV.

- FROGS\_0 Demultiplex reads Attribute reads to samples in function
- FROGS\_1 Pre-process merging, denoising and dereplication
- FROGS\_2 Clustering swarm Single-linkage clustering on sequences
- FROGS\_Cluster\_Stat Process some metrics on clusters
- FROGS\_3 Remove chimera Remove PCR chimera in each sample
- FROGS\_4 Cluster filters Filters clusters on several criteria.
- FROGS ITSx Extract the highly variable ITS1 and ITS2 subregions from reads
- FROGS\_5 Taxonomic affiliation Taxonomic affiliation of each ASV
- FROGS\_6\_Affiliation\_Stat Process some metrics on taxonomies
- FROGS Tree Reconstruction of phylogenetic tree
- FROGS Affiliation Filters Filters ASVs on several affiliation criteria
- FROGS Affiliation postprocess Aggregates ASVs based on alignment
- FROGS Abundance normalisation Normalise ASV abundance.
- FROGSFUNC\_1\_placeseqs\_and\_copynumbers Places ASVs into a random
- FROGSFUNC\_2\_functions Calculates functions abundances in each
- FROGSFUNC\_3\_pathways Calculates pathway abundances in each
- FROGS BIOM to std BIOM Converts a FROGS BIOM in fully compatible
- FROGS TSV\_to\_BIOM Converts a TSV file in a BIOM file 1
- FROGS BIOM to TSV Converts a BIOM file in TSV file**
- FROGSSTAT Phyloseq Import Data from 3 files: biomfile, samplefile
- FROGSSTAT Phyloseq Composition Visualisation with bar plot and
- FROGSSTAT Phyloseq Alpha Diversity with richness plot
- FROGSSTAT Phyloseq Beta Diversity distance matrix
- FROGSSTAT Phyloseq Sample Clustering of samples using different
- FROGSSTAT Phyloseq Structure Visualisation with heatmap plot and
- FROGSSTAT Phyloseq Multivariate Analysis Of Variance perform M
- FROGSSTAT DESeq2 Preprocess import a Phyloseq object and preprocess
- FROGSSTAT DESeq2 Visualisation to extract and visualise different

# Exercise

---

5. Click again on the "eye"  on the new output generated.

Or open it in your favorite spreadsheet (Excel, google sheet, Calc...) !

Now, what do you think about the file format? What does it contain?

# Exercise

---

## 6. Observe and describe

- In FROGS BIOM to TSV: abundance\_silva.tsv, the different columns of cluster 3
  - a. how would you qualify the alignment between the ASV3 seed and the sequences of the silva database?
  - b. What does it mean e-value = 0 ?
  - c. What is the header of column that shows the sequence of ASV seed ?
  - d. How many sequences have ASV3 in total ?
  - e. How many sequences have ASV3 in MVT0.LOT10 ? What is the sample where ASV3 is absent ?

# Exercise

---

## 7. Observe and describe

- In FROGS BIOM to TSV: multi\_affiliations.tsv, identifies the lines corresponding to cluster3
  - a. Why cluster3 has a multi-affiliation for species ?
  - b. Why “Bacteria;Firmicutes;Bacilli;Lactobacillales;Lactobacillaceae;Lactobacillus;Lactobacillus sakei” is present 74 times ?

Q1: What are the « **FROGS\_5 taxonomic affiliation tool** » output files ?

Q2: How many sequences are affiliated by BLAST ?

# Exercise

Answer 1

21: FROGS\_5 Taxonomic affiliation: report.html

20: FROGS\_5 Taxonomic affiliation: affiliation\_abundance.biom

Answer 2

All sequences have a blast affiliation

Answer 3

Q3: How many ASV have a “multiaffiliation” at Order ranks ?

Most of ASVs are ambiguous at species rank. For this study, V1V3 amplicon is not resolute enough to identify the species.

### Blast multi-affiliation summary

2.83% of ASV are ambiguous until Order rank

Q4: Click on the « eye » button on the BIOM output file, what do you understand ?

```

The biom file is not a human readable format. It is only very useful for bioinformaticians. To read the abundance table you have to transform the BIOM file in TSV file thanks to **BIOM\_to\_TSV** tool.

Answer 5

Q5: what do you think about the TSV file format? What does it contain?

The TSV format: tabular separated Value.  
Universal format, ideal for different spreadsheets.

This file contain the abundance table and information about affiliation of ASVs.

## Answer 6

- a. how would you qualify the alignment between the ASV3 (cluster\_3) seed and the sequences of the silva database?

Alignment is perfect ! 100% identity and 100% coverage between ASV3 (cluster 3) seed and the 520 nucleotides of sequence from silva database

- b. What does it mean e-value = 0 ?

The expect value is a parameter that describes the number of hits one can "expect" to see by chance when searching a database of a particular size. The lower the e-value, or the closer it is to zero, the more "significant" the match is.

- c. What is the header of column that shows the sequence of ASV seed ?

Seed\_sequence

- d. How many sequences have ASV3 (cluster\_3) in total ?

40711 found in column " observation\_sum"

- e. How many sequences have ASV3 (cluster\_3) in MVT0.LOT10 ? What is the sample where ASV3 (cluster\_3) is absent ?

MVT0.LOT10
4
0
6722
13
20

CDT0.LOT02
64
1
0
0
3

We can remark that ASV3 is particularly present in MV samples and rare in CD samples

## Answer 7

- a. Why ASV3 (cluster\_3) has a multiaffiliation for species ?

In multi-affiliations.tsv file, for cluster\_3, we observe that 75 affiliations are possible for this ASV at species rank.

All strictly equivalent 100% identity and 100% coverage with 75 different sequences of silva database.

ctobacillus;Lactobacillus sakei	CP025206.1448122.1449699	100	100	0	520
ctobacillus;Lactobacillus sakei	CP020806.1000690.1002267	100	100	0	520
ctobacillus;Lactobacillus sakei	CP025839.1959094.1960671	100	100	0	520
ctobacillus;unknown species	KF601977.1.1550	100	100	0	520
ctobacillus;Lactobacillus sakei	CP020806.811637.813214	100	100	0	520
ctobacillus;Lactobacillus sakei	CP020806.1103805.1105382	100	100	0	520
ctobacillus;Lactobacillus sakei	CP020806.1109220.1110797	100	100	0	520

- b. Why “Bacteria;Firmicutes;Bacilli;Lactobacillales;Lactobacillaceae;Lactobacillus;Lactobacillus sakei” is present 74 times ?

Because these are 74 different strains of *L. sakei*. They have blast ID different.

# Silva pintail or not pintail ?

---

Pintail\* represents the probability that the rRNA sequence contains anomalies or is a chimera, where 100 means that the probability for being anomalous or chimeric is low.

4 ranks of available databases in FROGS: 50 pintail, 80 pintail or 100 pintail or no pintail filter.

```
silva138.1 16S

- you have a preconceived notion
- you are familiar with the environment being studied
- you are looking for specific organisms as pathogens
- you collect bibliographical information

Ex:

*Staphylococcus saprophyticus* is a bacterium that can cause urinary tract infections in young women

and

*Staphylococcus xylosus* exists as a commensal on the skin of humans and animals and in the environment. It appears to be much more common in animals than in humans. *S. xylosus* has very occasionally been identified as a cause of human infection.

Maybe, for this cluster, *S. xylosus* is better

# Affiliation explorer

<https://shiny.migale.inrae.fr/app/affiliationexplorer>

The screenshot shows the Affiliation Explorer web application. On the left, there are three upload sections: 'Upload Biom File' (Galaxy37-[f]), 'Optional: upload Fasta File' (Galaxy32-[f]), and 'Upload MultiHits TSV File' (Galaxy42-[f]). Each section has a 'Browse...' button and an 'Upload complete' button. A 'Download' button is at the bottom of the sidebar. The main area has two tabs: 'Affiliation selection' and 'Affiliation edition'. Under 'Affiliation selection', there is a 'Select OTU' dropdown menu set to 'Cluster\_3', and 'Update OTU' and 'Skip OTU' buttons. Below this, a message states: 'Cluster\_3 - 2 conflicting affiliations, ambiguity at rank Species'. A note says: 'Select new affiliation by clicking on a row (double click on a cell to edit its content). Click "Update OTU" to update affiliation (with selected row) or "Skip OTU" to move to the next one.' There is a 'Show 10 entries' dropdown and a search box. A table displays two entries with columns: Kingdom, Phylum, Class, Order, Family, Genus, Species, Blast ID, %id, and %cov. Entry 1: Kingdom: Bacteria, Phylum: Firmicutes, Class: Bacilli, Order: Lactobacillales, Family: Lactobacillaceae, Genus: Latilactobacillus, Species: Lactobacillus sakei, Blast ID: CP032640.225274.226851, %id: 100, %cov: 100. Entry 2: Kingdom: Bacteria, Phylum: Firmicutes, Class: Bacilli, Order: Lactobacillales, Family: Lactobacillaceae, Genus: Latilactobacillus, Species: unknown species, Blast ID: KF601977.1.1550, %id: 100, %cov: 100. Below the table, it says 'Showing 1 to 2 of 2 entries' and 'Previous 1 Next'. There is also a 'Show sequence' checkbox.

	Kingdom	Phylum	Class	Order	Family	Genus	Species	Blast ID	%id	%cov
1	Bacteria	Firmicutes	Bacilli	Lactobacillales	Lactobacillaceae	Latilactobacillus	Lactobacillus sakei	CP032640.225274.226851	100	100
2	Bacteria	Firmicutes	Bacilli	Lactobacillales	Lactobacillaceae	Latilactobacillus	unknown species	KF601977.1.1550	100	100

A very user-friendly tool, developed by Mahendra Mariadassou and his collaborators (Maiage unit - INRAE Jouy-en-Josas). It allows to modify very simply the affiliations of an abundance table from FROGS.

# Affiliation explorer

<https://shiny.migale.inrae.fr/app/affiliationexplorer>

Demo  
video

The screenshot shows a web browser window displaying the 'Affiliation explorer' Shiny application. The browser's address bar shows the URL: `https://hub.gke2.mybinder.org/user/mahendra-mariad-liationexplorer-4jqjb7jw/rstudio/?token=r0mZweROqcCzicA5hQm8IA&view=shiny`. The application interface has a dark blue header with the title 'Affiliation explorer' and a hamburger menu icon. Below the header, there are three file upload sections on the left side: 'Upload Biom File', 'Optional: upload Fasta File', and 'Upload MultiHits TSV File'. Each section contains a 'Browse...' button and a 'No file sele...' button. The main content area has two tabs: 'Affiliation selection' (active) and 'Affiliation edition'. Below the tabs, there is a text prompt: 'Please upload your data (Biom file and MultiHits TSV file)'. The browser window also shows a 'Publish' button in the top right corner.

# Practice:

---

LAUNCH THE FROGS\_6 AFFILIATION STAT TOOL

# Exercice:

---

Go to history « 16S » history

Launch the « FROGS\_6 Affiliation Stat » tool on last affiliation\_abundance.biom

→ objectives :

understand rarefaction curves and the diversity diagram

# Exercise:

---

1. Build the **rarefaction** curve on genus rank with the 10 samples that contain the least number of different genus.
2. SFT0.LOT06 and MVT0.LOT10 have they been sequenced deeply enough?
3. Build the **distribution** on FC samples *i.e.* “Filet de Cabillaud”
4. How many sequences are some *Brochothrix thermosphacta* ?
5. On the total of sequences, what is the proportion affiliated to the Firmicutes?
6. Among Firmicutes, how many are Bacilli ?
7. But what is the proportion of Firmicutes in the total of sequence of all sample ?
8. How many ASVs are align perfectly with a database sequence ?

Answer 1

Q1: Build the **rarefaction** curve on genus rank with the 10 samples that contain the least number of different genus.

<input type="checkbox"/>	Samples	Nb domain	Nb phylum	Nb class	Nb order	Nb family	Nb genus	Nb species	Nb sequences
<input checked="" type="checkbox"/>	SFT0.LOT06	1	4	5	9	14	35	57	8,821
<input checked="" type="checkbox"/>	SFT0.LOT01	1	4	6	13	27	39	63	8,859
<input checked="" type="checkbox"/>	FCT0.LOT01	1	5	6	13	24	41	96	8,504
<input checked="" type="checkbox"/>	SFT0.LOT05	1	5	7	18	32	50	95	8,728
<input checked="" type="checkbox"/>	SFT0.LOT08	1	4	6	13	33	53	77	8,788
<input checked="" type="checkbox"/>	BHT0.LOT01	1	7	9	20	35	55	83	8,750
<input checked="" type="checkbox"/>	SFT0.LOT04	1	6	8	17	34	55	83	8,750
<input checked="" type="checkbox"/>	SFT0.LOT03	1	5	8	17	34	55	83	8,750
<input checked="" type="checkbox"/>	SFT0.LOT02	1	6	7	17	34	55	83	8,750
<input type="checkbox"/>	MVT0.LOT10	1	4	5	17	31	57	83	9,143
<input type="checkbox"/>	CDT0.LOT02	1	6	8	22	36	58	85	8,750

1. Sort the table by genus number

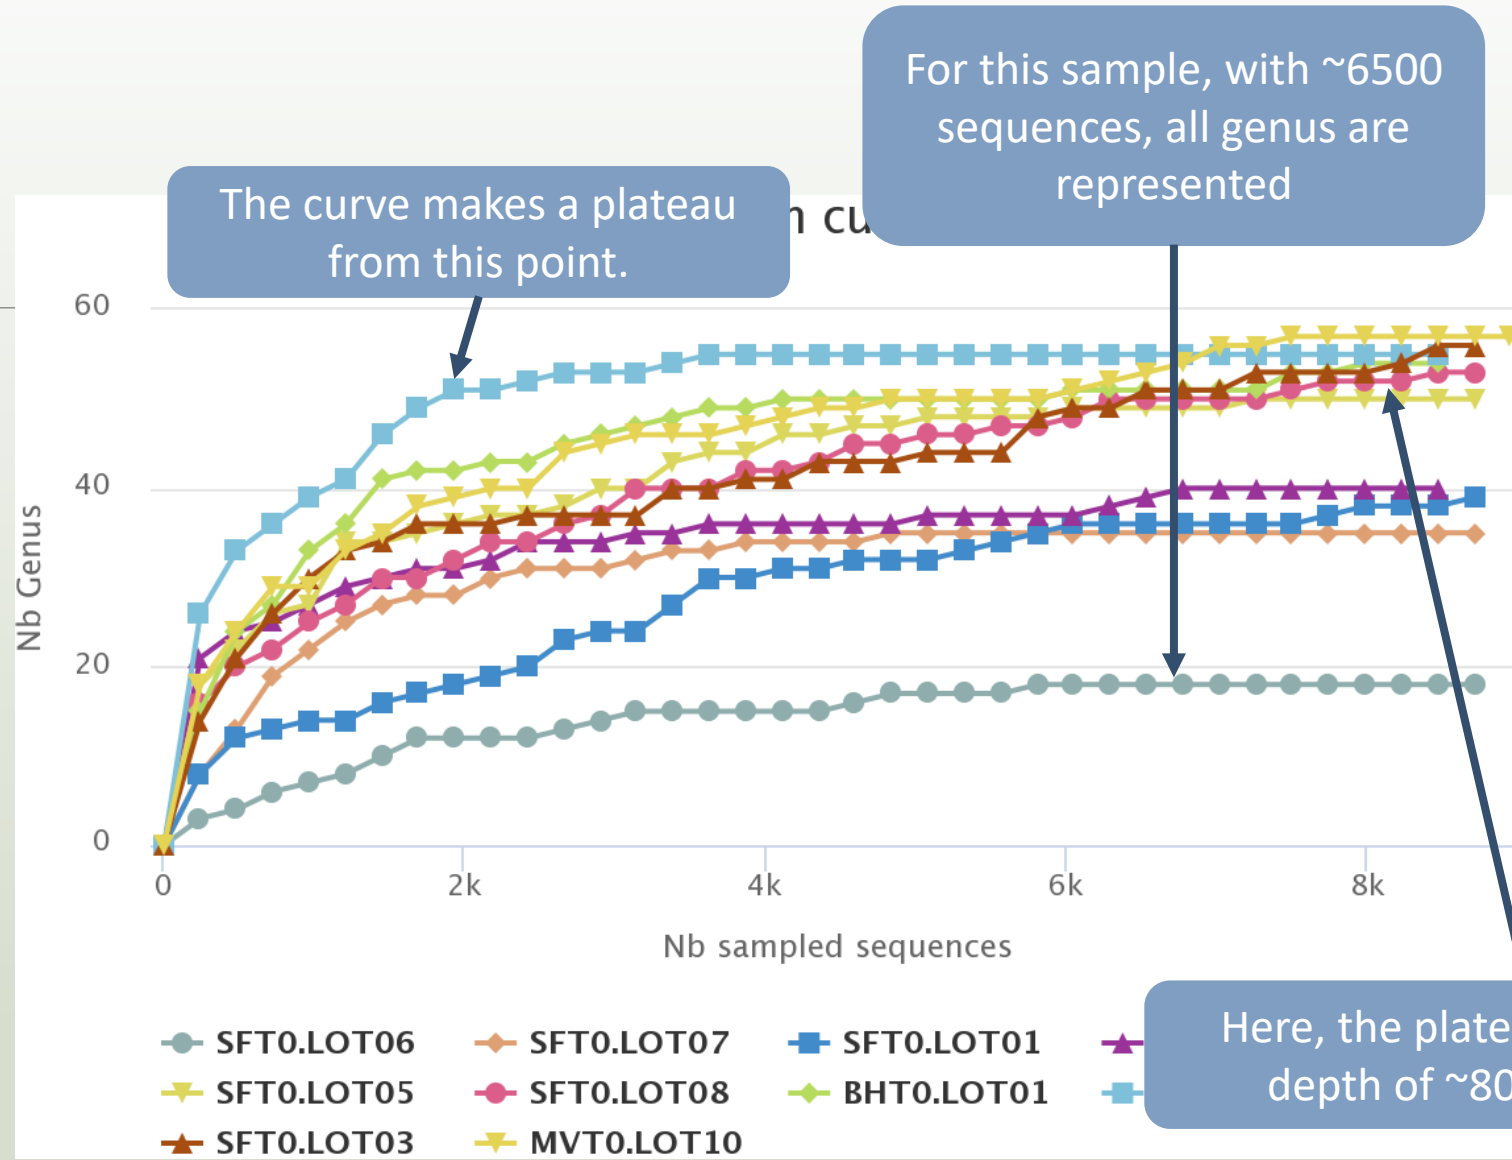

2. Select the 10 first samples

3. At the bottom of the table click on

With selection: Genus

Answer 2

Q2: SFT0.LOT06 and MVT0.LOT10 have they been sequenced deeply enough?

The curve makes a plateau from this point.

For this sample, with ~6500 sequences, all genus are represented

Here, the plateau comes with a depth of ~8000 sequences

Answer 2

Q2: SFT0.LOT06 and MVT0.LOT10 have they been sequenced deeply enough?

For MVT0.LOT10, the plateau does not seem to have been reached. Perhaps it should have been sequenced more deeply?

With ~8000 sequences, all genera for this species are represented

Q3: Build the **distribution** on FC samples *i.e.* "Filet de Cabillaud"

Use search to find only FC samples

Show Select the 8 samples of FC  Search CSV

<input checked="" type="checkbox"/>	Samples	Nb domain	Nb phylum	Nb class	Nb order	Nb family	Nb genus	Nb species	Nb sequences
<input checked="" type="checkbox"/>	FCT0.LOT01	1	5	6	13	24	41	96	8,504
<input checked="" type="checkbox"/>	FCT0.LOT02	1	6	8	23	40	67	126	7,638
<input checked="" type="checkbox"/>	FCT0.LOT03	1	8	10	26	45	71	122	8,608
<input checked="" type="checkbox"/>	FCT0.LOT05	1	8	10	25	44	78	139	8,577
<input checked="" type="checkbox"/>	FCT0.LOT06	1	8	10	29	53	97	141	8,577

Brochothrix	2649	3.941	100.000
Brochothrix thermosphacta	2649	3.941	100.000

Brochothrix thermosphacta nb children: 0

- 2649 sequences are some *Brochothrix thermosphacta*
- Firmicutes represent ~30% of total of sequences of these samples
- 99.6% of Firmicutes are Bacilli

# Answer 7

Q7: But what is the proportion of Firmicutes in the total of sequence of all sample ?

Taxonomy distribution Alignment distribution

With selection:

Q7: But what is the proportion of Firmicutes in the total of sequence of all sample ?

Click on Firmicutes

Name	Size	Global %	Parent %
root	547520		
Bacteria	547520	100.000	100.000
Firmicutes	342411	62.539	62.539

Firmicutes represent 62% of Bacteria

Answer 7

Q7: But what is the proportion of Firmicutes in the total of sequence of all sample ?

To focus on Firmicutes, double click on. After you can apply color among rank depth.

Q8: How many ASVs align perfectly with a database sequence ?

At the top of the page, click on this tab

210 sequences are aligned with 100% identity and 100% coverage with a sequence of silva.

---

# Download your data

---

In order to share resources as well as possible, files that have not been accessed for more than 120 days are regularly purged. The backup of data generated using of Galaxy is your responsibility.

You have 2 backup possibilities:

1. Save your datasets one by one using the "floppy disk" icon.

2. Or export each history.

To export a history, from the "History" menu, click on the arrow, then "Export History to File":

The screenshot shows a Galaxy history window titled "20: FROGS BIOM to TSV: abundance.tsv" with 495 lines and 1 comment. The format is "tabular". A red arrow labeled "1" points to the floppy disk icon in the bottom toolbar. A second red arrow labeled "2" points to the dropdown menu, where the option "Exporter l'Historique dans un fichier" is highlighted.

The "Export history archive" dialog box displays a button "to a link" and a text area with the link: <https://metabarcoding.usegalaxy.fr/api/histories/3e1619f028ae7909/exports/63d11d232c253fb8>. A red arrow labeled "2" points to the link area. A warning message at the bottom states: "History archives are removed at regular intervals. For permanent storage download the archive, export to a remote file or import the archive on another Galaxy server."
